Statistics Canada Statistique Canada

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, nº du catalogue 11-003F.

Series published in this Review are available on print-outs or from CANSIM, the computerized time series data bank of Statistics Canada, in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The data in the base may therefore be more timely than data on the CSR tape. For additional information see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variance.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

..	figures not available
...	figures not appropriate or not applicable
--	amount too small to be expressed
-	nil or zero.
†	advance estimates.
p	preliminary figures.
r	revised figures.
x	confidential to meet secrecy requirements of the Statistics Act.
MCD	months for cyclical dominance (see above).

Section 1. Selected Economic Indicators – Analytical Summary

Charts ... 8 - 13
Analytical Summary ... 14 - 17

Section 2. Population Statistics

1. Population, by Province ... 18
2. Immigration to Canada, by Country of Last Permanent Residence ... 18
3. Immigration to Canada, by Province of (Intended) Destination ... 18
4. Immigration to Canada, by (Intended) Occupational Group ... 18
5. Births, by Province ... 19
6. Deaths, by Province ... 19
7. Marriages, by Province ... 19

Section 3. System of National Accounts

1. Income and Expenditure Accounts

1.1. National Income and Gross National Product ... 20
1.2. Gross National Expenditure, Current Dollars ... 20
1.3. Gross National Expenditure, Constant Dollars ... 21
1.4. Sources of Personal Income ... 21
1.5. Disposition of Personal Income ... 22
1.6. Sources and Disposition of Gross Saving ... 22
1.7. Government Revenue, Expenditure, and Surplus or Deficit, by Level of Government ... 23
1.8. Implicit Price Indexes ... 27
1.9. Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost ... 27

2. Domestic Product by Industry

2.1. Real Domestic Product by Industry of Origin, Quarterly ... 28
2.2. Real Domestic Product by Industry of Origin, Monthly ... 29
2.3. Industrial Production ... 31

3. Financial Accounts

3.1. Financial Flows ... 36

4. Balance of International Payments

4.1. Canadian Balance of International Payments, Current Account, All Countries ... 38
4.2. Canadian Balance of International Payments, Current Account, Country Distribution ... 38
4.3. Canadian Balance of International Payments, Capital Accounts, All Countries ... 39

Section 4. Labour

1. Wages and Salaries, by Province ... 40
2. Wages and Salaries, by Industry ... 41
3. Labour Force Characteristics ... 42
4. Selected Series by Sex and Main Age Group
 4.1 Employed ... 43
 4.2 Unemployed ... 43
 4.3 Participation Rates ... 44
 4.4 Unemployment Rates ... 44
5. Labour Force Regional Data
 5.1 Labour Force ... 45
 5.2 Employed ... 45
 5.3 Employed in Non-agriculture ... 46
 5.4 Unemployed ... 46
 5.5 Participation Rates ... 47
 5.6 Unemployment Rates ... 47

Section 4. Labour – Concluded

6. Activities of Unemployment Insurance Commission ... 48
7. Time Lost in Work Stoppages ... 49
8. Employment Indexes, by Industrial Division ... 50
9. Employment Indexes, by Province ... 51
10. Employment Indexes, by Manufacturing Industry ... 52
11. Average Weekly Wages and Salaries, by Industrial Division ... 52
12. Average Weekly Wages and Salaries, by Manufacturing Industry ... 53
13. Average Weekly Wages and Salaries, by Province ... 53
14. Average Hourly Earnings ... 54
15. Average Weekly Hours ... 55

Section 5. Prices

1. Industry Selling Price Indexes ... 56
2. General Wholesale Price Index ... 59
3. Other Price Indexes ... 59
4. Consumer Price Index ... 60

Section 6. Manufacturing

1. Total Inventories, Shipments, Orders ... 61
2. Manufacturing Shipments, Selected Industries ... 62
3. Manufacturing Inventories, Selected Industries ... 64
4. Manufacturing Shipments and Unfilled Orders by Economic Use Classification ... 66
5. Manufacturing Industries, Owned and Raw Materials by Economic Use Classification ... 67
6. Manufacturing Goods in Process and Finished Products by Economic Use Classification ... 68
7. Tobacco and Beverages ... 69
8. Rubber ... 69
9. Rubber Products ... 70
10. Raw Hides, Skins, Finished Leather ... 70
11. Footwear Production ... 71
12. Primary Textiles ... 71
13. Production of Sawn Lumber ... 72
14. Pulpwood, Wood Pulp and Newsprint ... 72
15. Primary Iron and Steel ... 73
16. New Motor Vehicles ... 74
17. Refrigerators, Freezers, Washing Machines and Clothes Dryers ... 75
18. Radio and Television Sets ... 75

Section 7. Fuel, Power, Mining

1. Electric Power ... 76
2. Electric Power Available, by Province ... 76
3. Coal and Coke ... 77
4. Crude Oil and Natural Gas ... 77
5. Petroleum Products ... 78
6. Metals ... 79
7. Non-metallic Minerals ... 80

Section 8. Construction

1. Building Permits, by Type ... 81
2. Building Permits, by Province ... 81
3. Dwelling Units Started, All Areas ... 82
4. Dwelling Units Completed, All Areas ... 82
5. Dwelling Units Under Construction, All Areas ... 82
6. Dwelling Units Started, Centres 10,000 and Over ... 83
7. Dwelling Units Completed, Centres 10,000 and Over ... 83
8. Dwelling Units Under Construction, Centres 10,000 and Over ... 84
9. Mortgage Loans, Approvals ... 84
10. Domestic Shipments of Building Materials by Canadian Manufacturers ... 85

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Help Wanted Index Now Available on CANSIM —

Quarterly indexes measuring help wanted advertising in 18 major metropolitan areas are used as indicators of the numbers of jobs available. Data for Canada and the five regions, from 1962 forward, are now available from CANSIM (Matrix 7, Series 1 to 1.5). To obtain these indexes, contact General Time Series Staff, Statistics Canada, R. H. Coats Bldg., Tunney's Pasture Ottawa, Ontario, (613-995-7406).

1974 CENSUS TEST – PREPARING FOR 1976

Victoria Wong*

On May 28, 1974, Statistics Canada carried out a census test in preparation for the 1976 national Census in the following regions: the Nipissing, Timiskaming and Témiscamingue areas, including North Bay; the south-central area of Saskatchewan, including Moose Jaw; and in the areas of Trois-Rivières and Trois-Rivières-Ouest in Quebec. This test, which covered about 84,000 households, was undertaken to assess plans and procedures for the 1976 Census of Canada.

Census tests are conducted before each quinquennial and decennial census to try out the content of the questionnaires and to measure the effectiveness of new procedures and techniques that are being planned for the forthcoming census. Between 1966 and 1969, Statistics Canada conducted a series of tests in preparation for the full-scale 1971 Census which concentrated largely on methodological issues, such as the optimum means of collecting and processing the information required by users. These tests examined the feasibility of various census-taking techniques such as self-enumeration, mail-out/mail-back procedures and sampling. In 1969, a dress rehearsal for 1971 tested as many facets of the complete census system as possible.

The 1974 census test was again a dress rehearsal, with the objective of critically examining the content, methodology, procedures, manuals, training techniques, quality standards, etc., that are planned for the 1976 Census. Close attention was paid to testing in such a manner that the results can be implemented for 1976. In addition, evaluations and recommendations arising from the 1971 Census have resulted in a number of changes in procedures and methodology that will be part of the 1976 Census. There will be, for instance, new procedures for enumerating institutions and establishments. These and other changes must be tested to ensure the efficient and effective operation of the 1976 Census.

Census Test Areas

There were three sites chosen for the 1974 census test – North Bay area, Moose Jaw area and Trois-Rivières area. By carrying out the 1974 test in more than one site, it will be possible to ascertain whether particular problems or successes are general or are confined to certain areas only, thus providing an indication of the nature and scope of any changes that may be needed. Also, it is impossible to cover all the objectives of the 1974 census test in one area. For instance, procedures designed to meet the language problems of field enumeration in bilingual areas can be tested most effectively in eastern Canada; whereas, the enumeration of non-resident agricultural holdings poses problems which are mainly confined to western Canada. The reasons for choosing these specific sites are as follows.

North Bay Area

Under the Ottawa Regional Office, this site affords a good test of procedures for issuing forms according to the official language of choice (English or French) of respondents. Also, there is a proliferation of special enumeration areas including a military establishments, Indian Reserves, various institutions and agricultural holdings.

Moose Jaw Area

Under the Winnipeg Regional Office, this site is especially suited for testing the enumeration of non-resident agricultural holdings. This site also satisfies the objective of testing decentralized logistics procedures. In addition, there are a number of special enumeration areas such as military establishments, institutions and Indian Reserves.

City of Trois-Rivières and Trois-Rivières-Ouest

This site is under the Montreal Regional Office. It is particularly suited to testing new approaches to geocoding in urban centres. To achieve the geographic test objectives in the summer of 1974, preliminary preparatory work was necessary with municipal officials of the above cities, including updating of street layouts and address ranges to be linked with Post Office codes.

Questionnaires

As in the 1971 decennial Census, there were three main types of questionnaires used in the 1974 test. (See the Appendix, page xx, for a list of the questions asked.)

1. **Population and Housing (Short and Long Forms).**
 (a) **Short Form Questionnaire** – This questionnaire contained six basic population questions; two housing questions; and five non-statistical questions to ensure completeness of coverage. It was distributed to two thirds of the households in a census test area.
 (b) **Long Form Questionnaire** – This questionnaire contained all the questions of the Short Form as well as 12 additional population questions. The long questionnaire was distributed to one third of the households in each census test area, and is referred to as the "sample" questionnaire.

* Victoria Wong is Head of the Documentation Unit, Evaluation Section, Data Capture Division of Statistics Canada's Census Field.

An instruction booklet was provided with the Population and Housing Questionnaires to assist respondents. Both the Long and Short Form Questionnaires are designed to allow for only six persons within one household to be enumerated on a single questionnaire. Thus, it may have been necessary for the Census Representative to drop off more than one document if there were more than six members of one household residing in a dwelling. If a household did **not** receive a sufficient number of documents, a telephone number was provided so respondents could request additional questionnaires.

2. **Agriculture Questionnaire**

This questionnaire contained 95 questions – about half as many as in the full-scale 1971 Census.) (See Appendix, page xx, for a list of subjects covered by the Agriculture Questionnaire.) All operators of agricultural holdings (as defined for census purposes) in the test areas were asked to complete the forms. However, since only a portion of the questions referred to any given type of farming, each operator probably would have completed only about a third of all the questions.

3. **Individual Census Questionnaire**

This population questionnaire was used for enumeration in special situations, including institutions such as hotels, hospitals, nursing home and temporary residences. It could also have been used by lodgers (in private-dwellings) who did not wish to be enumerated on the regular Population and Housing Questionnaire for the household in which they resided.

The Use of Sampling

Sampling has the effect of minimizing the response burden on householders, reducing the costs of field collection and office processing, and improving timeliness. Thus, sampling was used in the 1974 test for all population questions except those on the Short Form Questionnaire. The quality of the remaining 12 "statistical" questions (asked on a sample basis for persons, 15 years of age and over) was maintained, even for small areas, by coupling the quality advantages of self-enumeration techniques with a very large sampling ratio of 33 1/3 per cent, identical to the sample size employed in the 1971 Census.

The Population and Housing Questionnaire designed for the 1974 census test and the 1976 Census contains about one-fourth as many questions as the full-scale 1971 Census. Therefore, because of the reduced questionnaire content for the smaller quinquennial "bench-mark" census of 1976, the time and cost savings resulting from sampling will be marginal compared with the full-scale content of the decennial 1971 Census. However, on balance, it appeared useful to retain sampling for the 1976 Census for its added values in terms of public relations and householder response.

Field Methodology

May 28th was "Census Day" for the 1974 test. Census information was to be collected for every Canadian resident who resided in each census test area at midnight May 27/28, 1974. All questions had to be answered by the householder as if it were May 28, 1974 regardless of the date on which he or she completed the questionnaire. Thus, the test conditions in the field duplicated those of the actual census which will be taken on June 1, 1976, on the same day of the week and at the same time of year. The June 1 date is traditionally chosen for censuses in Canada since it takes into account the problems of spring and winter rural travel conditions yet is early enough to avoid the enumeration problems of heavy vacation movements of families to summer cottages, etc.

As in the 1971 Census, the principal methodology used in the 1974 census test was self-enumeration. Statistics Canada believes that self-enumeration produces more accurate census information. It has been proven through research, that the Census Representative's presence at an interview can bias the respondent's answer. In addition, the self-enumeration process gives the respondent time to consider the questions and, if necessary, to consult family records, so that he or she is not hurried into giving quick, and perhaps approximate replies. It also alleviates many problems of call-backs to urban households where no one is at home.

Self-enumeration in the 1974 test involved two methods: drop-off/mail-back and drop-off/pick-up. (A third method possible with self enumeration – mail-out/mail-back was not used in the 1974 test.)

The drop-off/mail-back method was used in urban areas with a population of 9,000 or more. The drop-off/pick-up method, in which the Census Representative returned to the household a few days after the drop-off to collect the completed forms, was used in the smaller urban centers and in rural areas. This pick-up method enabled the Census Representative to check the entries and answer any questions the respondents encountered in completing the form. In the mail-back method, Census Representatives checked the mailed-in forms and then phoned the householders for missing or incorrect information or, if necessary, re-visited the dwelling.

During the enumeration period, assistance was available to all respondents, in both urban and rural areas, through the Telephone Assistance Service.

Processing of Questionnaires

As in other aspects of this "dress rehearsal", the principal objective of the processing operations of the 1974 census test was to rest Regional and Head Office processing procedures under conditions which simulate the relative volume and time constraints expected to be experienced in 1976.

Regional Office Processing

To meet the above objective for 1976, all phases and operations of regional office processing are being analyzed in an actual simulation of the procedures with specific interest on key areas of operations. The following are some of the areas being studied:

(a) work simplification in each manual processing operation in order to increase efficiency;

(b) the methods for staff recruitment, in particular Regional Processing Managers;

(c) training procedures, particularly with respect to programmed learning format, presentation, use of training aids, comprehension, retention, use of manuals for problem-solving during processing;

(d) the effectiveness of a "hold period" prior to Head Office processing used to solve geographic problems and perform necessary field coverage checks.

Head Office Processing

Head Office processing procedures planned for the 1976 Census are more automated than those used in 1971. Therefore, almost every processing operation in Head Office has changed. The most radical changes include the correction of data indicated for review through direct terminal input and an automated system for process control. Thus, the major objectives of the Head Office processing in the 1974 census test are:

(a) to test a system to control all processing steps involved in taking the data from the questionnaire by microfilming, its transfer onto magnetic tape using FOSDIC,[1] and subsequent submission to the editing phases;

(b) to test a system developed to edit the data which ensures the validity of individual responses and the validity of related responses using the "hot-deck approach" (a method designed to check and impute responses on the basis of other related data);

(c) to test a system for the automatic imputation of incomplete or invalid data, also using the "hot-deck approach";

(d) to test a retrieval system which allows predetermined or *ad hoc* demand requests to be serviced on either the non-imputed or imputed census data base, and in a format suitable for immediate use or for publication;

(e) to test the integration of the geographic code master file system into the automated process control system.

[1] FOSDIC is a Film Optical Scanning Device for Input into Computers. It is used to transfer data from the questionnaires to microfilm and to machine-readable magnetic tape.

Tabulations and Publications

At the present time, it is not planned to release publications based on the 1974 census test data. The purpose of the test is to ensure that the automated retrieval systems (including photocomposition and photocopy, and those designed for the internal checking of totals and subtotals for consistency between tables) will meet the 1976 program objectives. Because the retrieval system will be designed to give random access to the data base, a large and costly preplanned tabulation program will not be necessary. Individual user requests for both standard and non-standard census areas will be accommodated either by employing standard geographic areas files, or with GRDSR (Geographically Referenced Data Storage and Retrieval System) for non-standard areas.

Evaluation Program

In developing the evaluation program for the 1974 census test, the approach has been to cover all aspects, insofar as possible, which are essential to planning the 1976 Census. To meet this objective, the scope of the 1974 evaluation program and the methodologies employed are directed toward two specific goals:

(a) the testing of evaluation systems that will be built into the 1976 Census; and

(b) the timely evaluation of the 1974 test (within stringent time-parameters) in order to identify potential problem areas so that planners may take remedial action prior to the 1976 Census.

The 1974 evaluation program consists of some 35 projects, many of which use built-in evaluation. In many cases, such evaluation consists of reviewing operations to ensure that they are consistent with the original plans; in other cases, it involves measuring and analyzing data. In all evaluation projects, methods have been developed for effective and efficient information capture. In contrast with the 1971 Census evaluation program, more emphasis during the 1974 census test will be placed on determining the efficiency of evaluation methodology (in terms of cost, time and accuracy) and less on the measurement of data quality *per se*. This concentration on improving evaluation methodology is expected to provide the basis for more effective analysis of the plans for the 1976 Census and therefore, to result in improvements in these plans.

APPENDIX: QUESTIONS USED IN THE 1974 CENSUS TEST

I. Population and Housing Questions

A. The following 6 questions were asked of everybody:

1. Name of person?
2. Relationship to head of household?
3. Sex (male or female)?
4. Marital status [single (never married), now married, widowed, divorced, separated]?
5. Mother tongue (language first spoken and still understood)?
6. Age (month and year of birth)?

B. The following 12 questions (and part-questions) were asked of persons 15 years of age and over, in only one third of the households.

7. Elementary, Secondary and Post-secondary Training:
 (a) What is the highest grade or year of elementary or secondary school you ever attended?
 (b) How many years of university level education have you completed?
 (c) How many years of non-university, post-secondary training at an educational institution have you completed? (e.g., teachers' college, nursing school, etc.).
8. Have you attended an educational institution at any time since last September?
9. What degrees, certificates or diplomas have you ever obtained?
10. Activity in the Labour Market:
 (a) Last week, how many hours did you work for pay (or in your own business, farm, or professional practice)?
 (b) Last week, how many hours did you help without pay in the operation of a family business or farm?
 (c) Last week, did you have a job from which you were on temporary lay-off for all or part of the week?
 (d) Last week, did you have definite arrangements to report to a new job at a future date?
 (e) Last week, did you have a job from which you were absent for all or part of the week because of illness, strike, vacation, training courses, etc.?
 (f) Did you look for work last week? (e.g., contact a Canada Manpower Centre, check with employers, place or answer newspaper ads, etc.)?
11. Where did you live 5 years ago on May 28, 1969?

C. The following 5 "non-statistical" questions were asked of all household heads (for editing and coverage purposes).

H1. Are there more than 6 persons in this dwelling?

H2. Is there anyone left out of Question 1 because you were not sure he or she should be listed?

H3. How many visitors, or other persons who have a usual home elsewhere in Canada, stayed overnight on May 27/28?

H4. At what telephone number can your household be reached?

H5. Do you enter your living quarters:
- by a separate private entrance from outside?
- through a common hall or passageway?
- through someone else's living quarters?

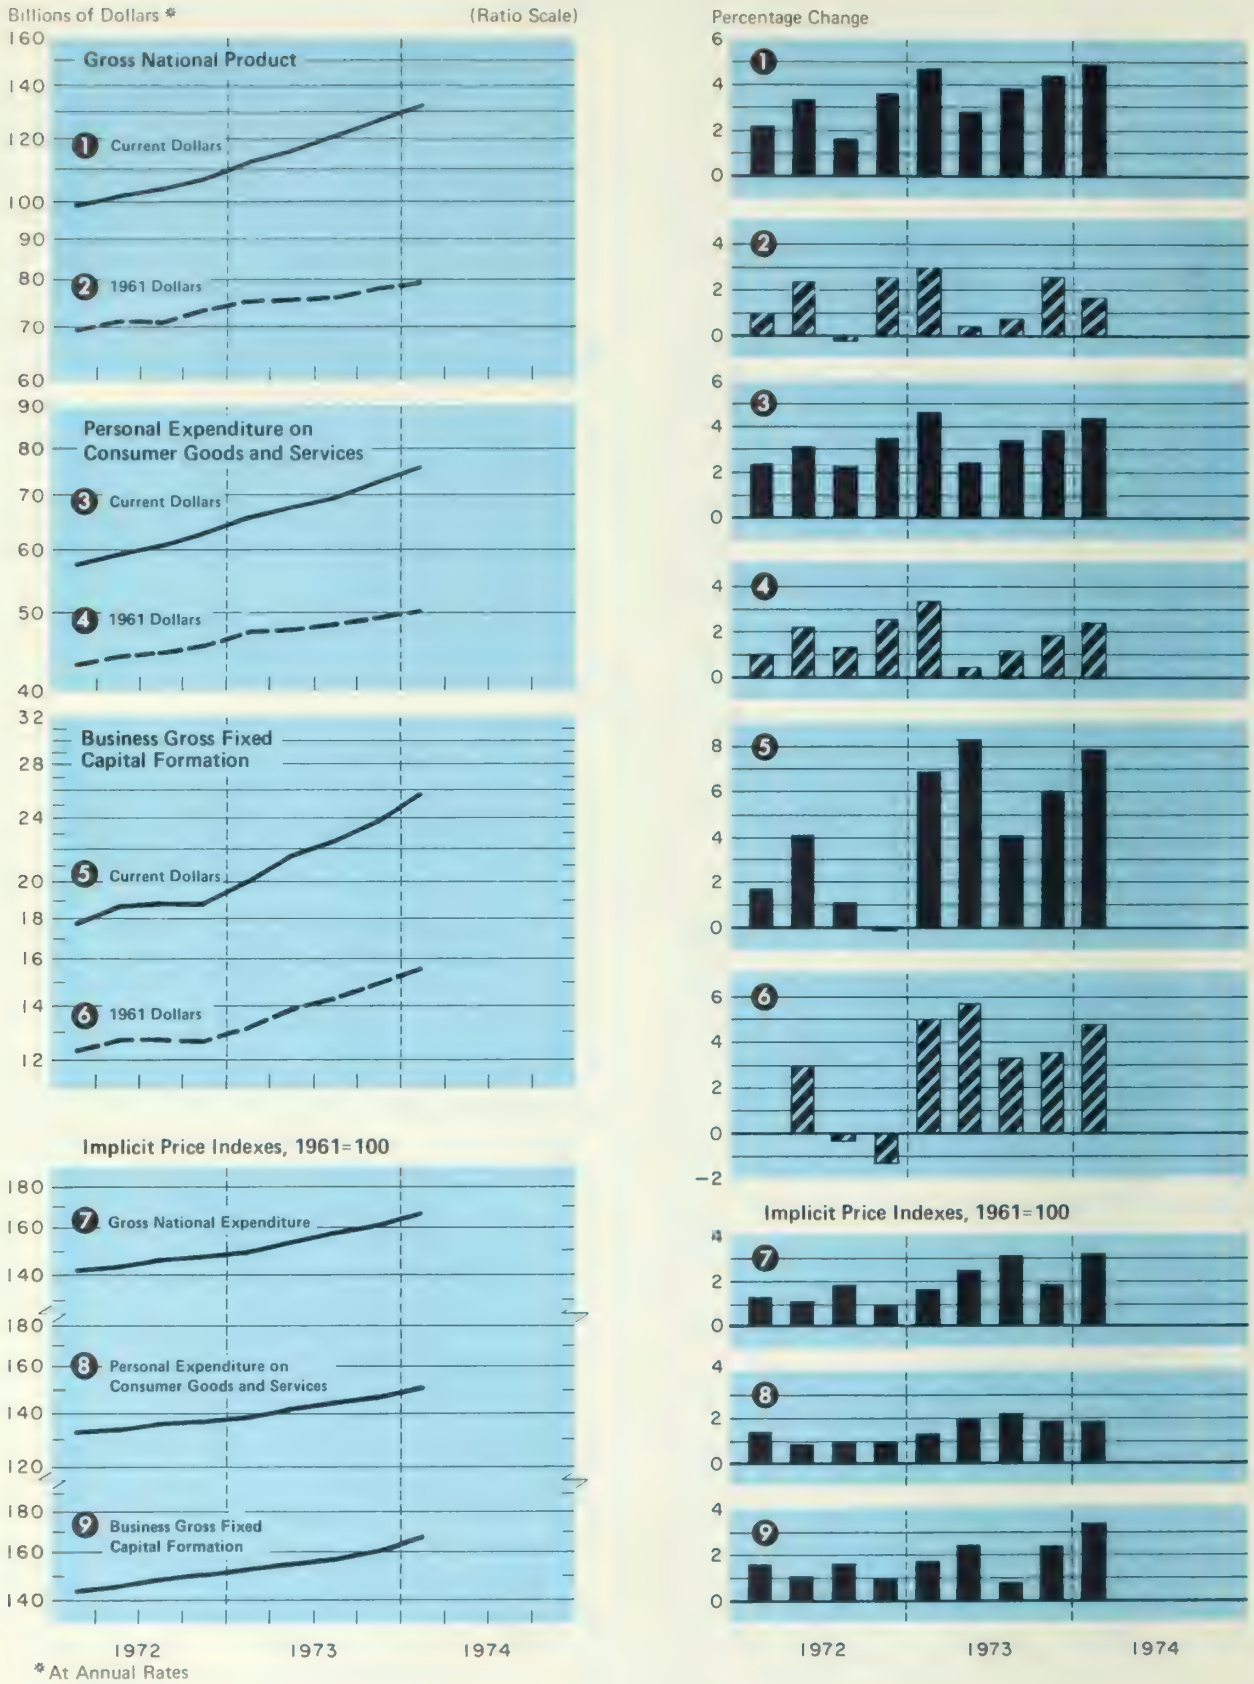

D. The following 2 housing questions were also asked of all household heads.

H6. Is this dwelling:
- owned or being bought by you (or a member of this household)?
- rented (even if no cash rent is paid to the landlord)?

H7. Is this dwelling a:
- single house?
- semi-detached or double house?
- duplex?
- row house?
- appartment or multiple dwelling?
- house attached to a non-residential structure?
- mobile home?
- other movable dwelling?

(Continued on page 114)

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. [1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitionérs. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. [4]The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source see Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

[1]The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

[1]Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2]Annual figures are averages of 12 months.
[3]Includes adjustments for cancellation of warrants and collection of overpayments. Sources: Statistical Report on the Operation of the Unemployment Insurance Act (73-001) Statistics Canada.

Table 7: time lost in work stoppages[1], based on the 1960 standard industrial classification[2] (thousand man-working days)

Year and month	total	forestry	fishing and trapping	mines, quarries, oil wells	manufacturing: total[3]	food and beverages	tobacco products	rubber	leather	textiles	knitting mills	clothing	wood	furniture and fixtures	paper and allied industries

[1]In calculating time loss, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers: the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, they also will be shown in the total. [3]Includes miscellaneous manufacturing industries. [4]Includes also publishing and allied industries. [5]Includes also the storage and communication industries. **Source: Labour Gazette, Department of Labour.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]Excludes agriculture, fishing, trapping and public administration and defence. [3]Includes storage, electric power, gas and water utilities. [4]Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]See footnote 1 and source in Table 9. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 8. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data for the current year are subject to revision. [2]Includes gold. [3]Consists of general wholesale index less animal products and vegetable products component groups. [4]Consists of iron products and non-ferrous metals products component groups less gold. [5]These two series comprise the general wholesale index. [6]Excludes gold. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1] Indexes prior to May 1973 incorporate 1961 expenditure weights; 1964 for Quebec City and Thunder Bay; those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2] The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3] Includes constant weighted food component. [4] These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C. P. I. major components from May 1973 forward. [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

annual average and month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month: owned[3]	inventory at end of month: held but not owned	all inventory held: total	all inventory held: raw materials	all inventory held: goods in process	all inventory held: finished products	ratio of inventories owned to shipments

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

Table 2: manufacturing shipments[1] by industry based on the 1970 standard industrial classification (million dollars)

annual average or month	total shipments	non-durable	durable	foods and beverages	tobacco products	rubber	leather	textile	knitting mills	clothing	wood

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended or cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2]Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3]Customs exports. [4]Mill shipments destined for export. **Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments** (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]The data are collected for 1,400 municipalities and individual figures are available on request. [2]Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William-Port Arthur to form Thunder Bay. **Source: Building Permits (64-001), Statistics Canada.**

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The [illegible]. Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property. Source: Canadian Housing Statistics, Central Mortgage and Housing Corporation.

[1]Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2]Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3]Includes rye, flaxseed, rapeseed, soybeans and corn. [4]Includes clover and grass seed, hay, clover, greenhouse products, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5]Made under the authority of the Agricultural Stabilization Act. **Source: Farm Cash Receipts (21-001), Statistics Canada.**

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to revision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Monthly totals for current years are not equivalent to annual data due to receipt of additionnal statistics which cannot be allocated by months. [2]Includes also seaweeds and other species such as whales, worms etc. [3]Exports include sea and freshwater fish and shellfish products but exclude bait, meal, oils, offal, livers, fish roe n.e.s. and fishery foods and feeds n.e.s. [4]Total holdings (all forms) of frozen fish commencing october 1969 excludes freshwater species.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7]The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Report, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories. **Source: Retail Trade (63-005), Statistics Canada.**

Note: Components may not add to totals due to rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortages home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans and bills owing doctors, dentists, lawyers, and other personal service credit as they are not available. [2]Owing to the considerable extent of common ownership and overlap of nction within these two groups of companies their holdings are treated jointly beginning in January 1970. [3]Conditional sales agreements held by sales finance ompanies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. Starting with January 970 this series affected by transfer of passenger cars financed for commercial purposes from consumer goods to commercial goods; from January 1971 amounts shown xclude unearned finance charges: for December 1970 this change had the effect of reducing the gross figure by 13.5 per cent. [4]Personal cash loans of up to $1,500. ade by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [5]Personal cash loans of over $1,500. usually epaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 6.5 per cent. [6]The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. Till December 1970 data for only Oil Companies. From first quarter 1971 figures include statistics for transportation and travel and entertainment card-issuing companies. For seasonal adjustment purposes seasonal factors for oil company credit cards were used to adjust the new series other credit card issuers on the assumption that the two series are subject to the same seasonal effects. [8]Bills due for residential/domestic use of telephones, gas and electric power. **Sources: onsumer Credit (61-004), Statistics Canada; Bank of Canada, and Dept. of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the erage of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery ve been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) w include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports** 5-007), **Statistics Canada.**

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

year and month	total railway revenue freight loadings (carload and non-carload) ('000 tons) unadj.	S.A.	total revenue cars loaded (carload only)	farm products and food: wheat	other grain and grain products	fresh fruits and vegetables	other agriculture products	animals and their products	prepared food products	mine products: iron ore and concentrates	other metal ores and concentrates	potash[2]	coal, sand, cement and other mine products

[1]Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973 only 6 major railways (accounting for 95% or more of the total operating revenues) are shown. [2]Includes traffic interchanged between Canadian railways. **Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, Statistics Canada.**

[1]Prior to 1970, figures included the operations of scheduled Canadian air carriers. Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. Note that Nordair is excluded prior to 1970. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

Note: Components may not add to totals due to partial revisions.

[1]End of period. [2]Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3]Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4]Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. [5]Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6]Allowance for the take-over of Nova Scotia Light & Power common shares. **Source: Bank of Canada Review.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base ...rals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks ...uded in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries ...cept electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. Source: Prices ... Price Indexes (62-002), Statistics Canada.

[1]The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation.The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. [2]In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. **Source: Commercial Failures (61-002) Quarterly, Statistics Canada.**

APPENDIX: QUESTIONS USED IN THE 1974 CENSUS TEST – Concluded

II. Agriculture Questions

The following questions were asked only of farm operators.

1. Name and address of farm operator
2. Location of agricultural holding
3. Total area of all land
4. Tenure (area owned, rented)
5. Market value of buildings and land

6-31. Area seeded to specified types of field crops

32-36. Total areas for vegetables, tree fruits, small fruits, nursery products, greenhouses and mushroom houses.

37-42. Acreages of cropland, improved land for pasture, summer fallow, other improved land, woodland, other unimproved land

43. Number of cattle and calves of specified types and age groups

44-47. Number of cows and heifers milked and pounds of milk produced

48-49. Milk shipments, May 1974

50-51. Number of pigs by age groups

52. Number of sheep and lambs

53. Kind and number of other livestock

54-57. Number of hens and chickens by types and age groups

58-60. Number of turkeys, geese, ducks

61-71. Number and market value of specified items of farm machinery and equipment

72. Weeks of paid labour hired during the past 12 months, by sex

73. Number of paid agricultural workers employed on a year-round basis

74. Number of days the operator worked off the farm during the past 12 months

75. Number of months the operator lived on this holding during the past 12 months

76. Type of organization (e.g., a privately-owned farm, or operated as an incorporated business, etc.)

77. Total value of agricultural products sold during 1973 (in value groupings)

Other Publications of the General Time Series Staff

cation
)er — Title and Description

)3F *Revue Statistique du Canada*, mensuel.
This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

)4 *Weekly Supplement to the Canadian Statistical Review*—Free to *Canadian Statistical Review* subscribers.

Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).

)6 *Annual Supplement to the Canadian Statistical Review*—Price $1.40 (Free to *Canadian Statistical Review* subscribers.)

Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).

-5 *Canadian Statistical Review—Historical Summary 1970*, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers)

This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

CANSIM Manuals and other Publications*

CANSIM: An Introduction to the Canadian Socio-economic Information Management System—Free on request.
Order by title from General Time Series Staff.

CANSIM: *Progress Report*—Free on request.
Order by title from General Time Series Staff.

Publication number — Title and Description

CANSIM Manuals and other Publications (Cont'd)

*12-530 *CANSIM: Operational Manual for Data Entry* (Occasional)—Price $1.40

This manual will be of practical interest only to federal government agencies which store and maintain time series in the CANSIM data base. Users desiring a fuller knowledge of the codes used and the storage methodology will find this volume a useful companion to the Retrieval manual. (Available in French, catalogue no. 12-530F.)

*12-531 *CANSIM: Users Manual for Data Retrieval and Manipulation* (Occasional) 1973 edition—Price $2.10

Gives detailed instructions on procedures for obtaining data from the CANSIM data base. The new edition reflects enlargement and improvement of the retrieval package. (Available in French, catalogue no. 12-531F.)

— CANSIM: *Summary Reference Index* (Annual, with periodic amendments) 1973 edition—Free on request.
This index summarizes data available from CANSIM and provides matrix identifiers.
Order by title from General Time Series Staff.

— CANSIM: *Series Directory* (Annual, with periodic amendments) 1973 edition—Price $15.00, or $20.00 with amendment service.

The CANSIM *Series Directory* contains matrix and series titles and descriptive detail for series available from CANSIM. It is used in conjunction with the *Summary Reference Index* and CANSIM *Manual for Data Retrieval and Manipulation* (12-531) to order series from Stastitics Canada.
Order by title from General Time Series Staff.

This Review, the above and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General of Canada. For further information direct inquiries to:

General Time Series Staff,
Statistics Canada,
Ottawa, K1A 0T6.

ndments to catalogue numbers 12-530 and 12-531 will be issued periodically and will be available from the Publications Distribution, ics Canada.

ARTICLE:

A Note on the Seasonal Adjustment of Economic Time Series

LIBRARY
SEP
UNIVERSITY OF TORONTO

Government Publications

Cette revue est disponible en édition française. Revue Statistique du Canada, nº du catalogue 11-003F.

Series published in this Review are available on print-outs or from CANSIM, the computerized time series data bank of Statistics Canada, in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The data in the base may therefore be more timely than data on the CSR tape. For additional information see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variance.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * * * *

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

..	figures not available
...	figures not appropriate or not applicable
--	amount too small to be expressed
-	nil or zero.
†	advance estimates.
p	preliminary figures.
r	revised figures.
x	confidential to meet secrecy requirements of the Statistics Act.
MCD	months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 9, Table 1 – Farm cash receipts

Two new series "Deferred Grain Receipts" (D 2903) and "Liquidation of Grain Receipts" (D 2904) have been introduced with this issue at the request of the source.

A NOTE ON THE SEASONAL ADJUSTMENT OF ECONOMIC TIME SERIES

Estela Bee Dagum*

Introduction

The development of electronic computers has eased the massive calculation burden of adjustment of economic time series for seasonal variation. It is now common practice to publish most economic indicators in both unadjusted and seasonally adjusted forms. This is not because one is more correct than the other, but because each has its own uses.

Although the problem of seasonal adjustment has a long history, today economic statisticians still are actively engaged in developing new techniques to improve the seasonal adjustment of different classes of series.

The meaning and the purpose of seasonal adjustment very often lead to some confusion in the minds of both laypersons and users of statistics – confusion probably arising from the restricted sense of the definition and the generality of the term "seasonal". For example, a common belief is that, by taking month-to-month comparisons of seasonally adjusted series, one can infer the current stage of the business cycle at which the economy stands. The presence of the irregular component in the seasonally adjusted series is completely ignored even though, except in a very few cases, the irregular is the most important factor affecting comparisons of one-month span for current estimates. Moreover, the irregular component in the current estimates is usually much larger than in the historical estimates because the current raw figures are preliminary, frequently based on small samples or partial returns, and because the seasonal factors used for their seasonal adjustment are forecasted.

In general, it is not possible to judge from the latest estimate of a seasonally adjusted series whether the cycle was rising or falling between the latest two months for which data are available. However, it is possible to tell the stage of the cycle by comparing the figure of the latest month and another about three months earlier. This is the way that seasonally adjusted data should be used by policy makers to judge what is happening in the economy. Even with this time lag, the information on the current economic conditions can be obtained by using seasonally adjusted series at least six months earlier than by using unadjusted data.

The aim of this paper is to contribute to an understanding of some basic aspects of seasonal adjustment. It is not a discussion of the technical, statistical and mathematical implications of methods for seasonal adjustment. The paper states simply what seasonal adjustment is and what it is not. It analyzes those components of an economic time series traditionally considered useful by economists and statisticians, and outlines the different types of seasonal pattern that might be present in the series. The paper also points out the advantages and limitations of using seasonally adjusted data and the need for revisions to the seasonal factors.

*Dr. Dagum is the head of the Seasonal Adjustment Unit of Statistics Canada's General Time Series Staff.

Components of a Time Series

Time series make up the most important basic elements for the description, explanation and forecasting of economic events. They are statistical records of the evolution of economic processes through time. They are generally compiled for consecutive and equal periods, such as weeks, months, quarters, years.

The oldest and most common assumption made regarding the behaviour of a time series is that the series is composed of two main parts; (1) a systematic component which is a deterministic function of time, and (2) a random component that is "well-behaved".[1]

Historically, this simple model was elaborated first in the research domain of Astronomy.[2] It was built to determine the position of the planets at a given moment of time. In such a case, errors in the observed time series are attributed to errors of observation due to atmospheric conditions or imperfections of the telescope. The errors will not affect later positions of the planets nor our observations of them.

This kind of model was later incorporated into Economics to describe the behaviour of economic events. Traditionally, economic statisticians have distinguished three different types of evolution within the systematic part, namely, (1) the trend, (2) the cycle, and (3) the seasonal variation.

The trend reflects long-term movements lasting many years. In some cases, it is a steady growth; while, in others, the trend may move downward as well as upward.

The cycle, usually referred to as the business cycle, is a quasi-periodic oscillation characterized by alternating periods of expansion and contraction. It lasts from three to four years on the average.

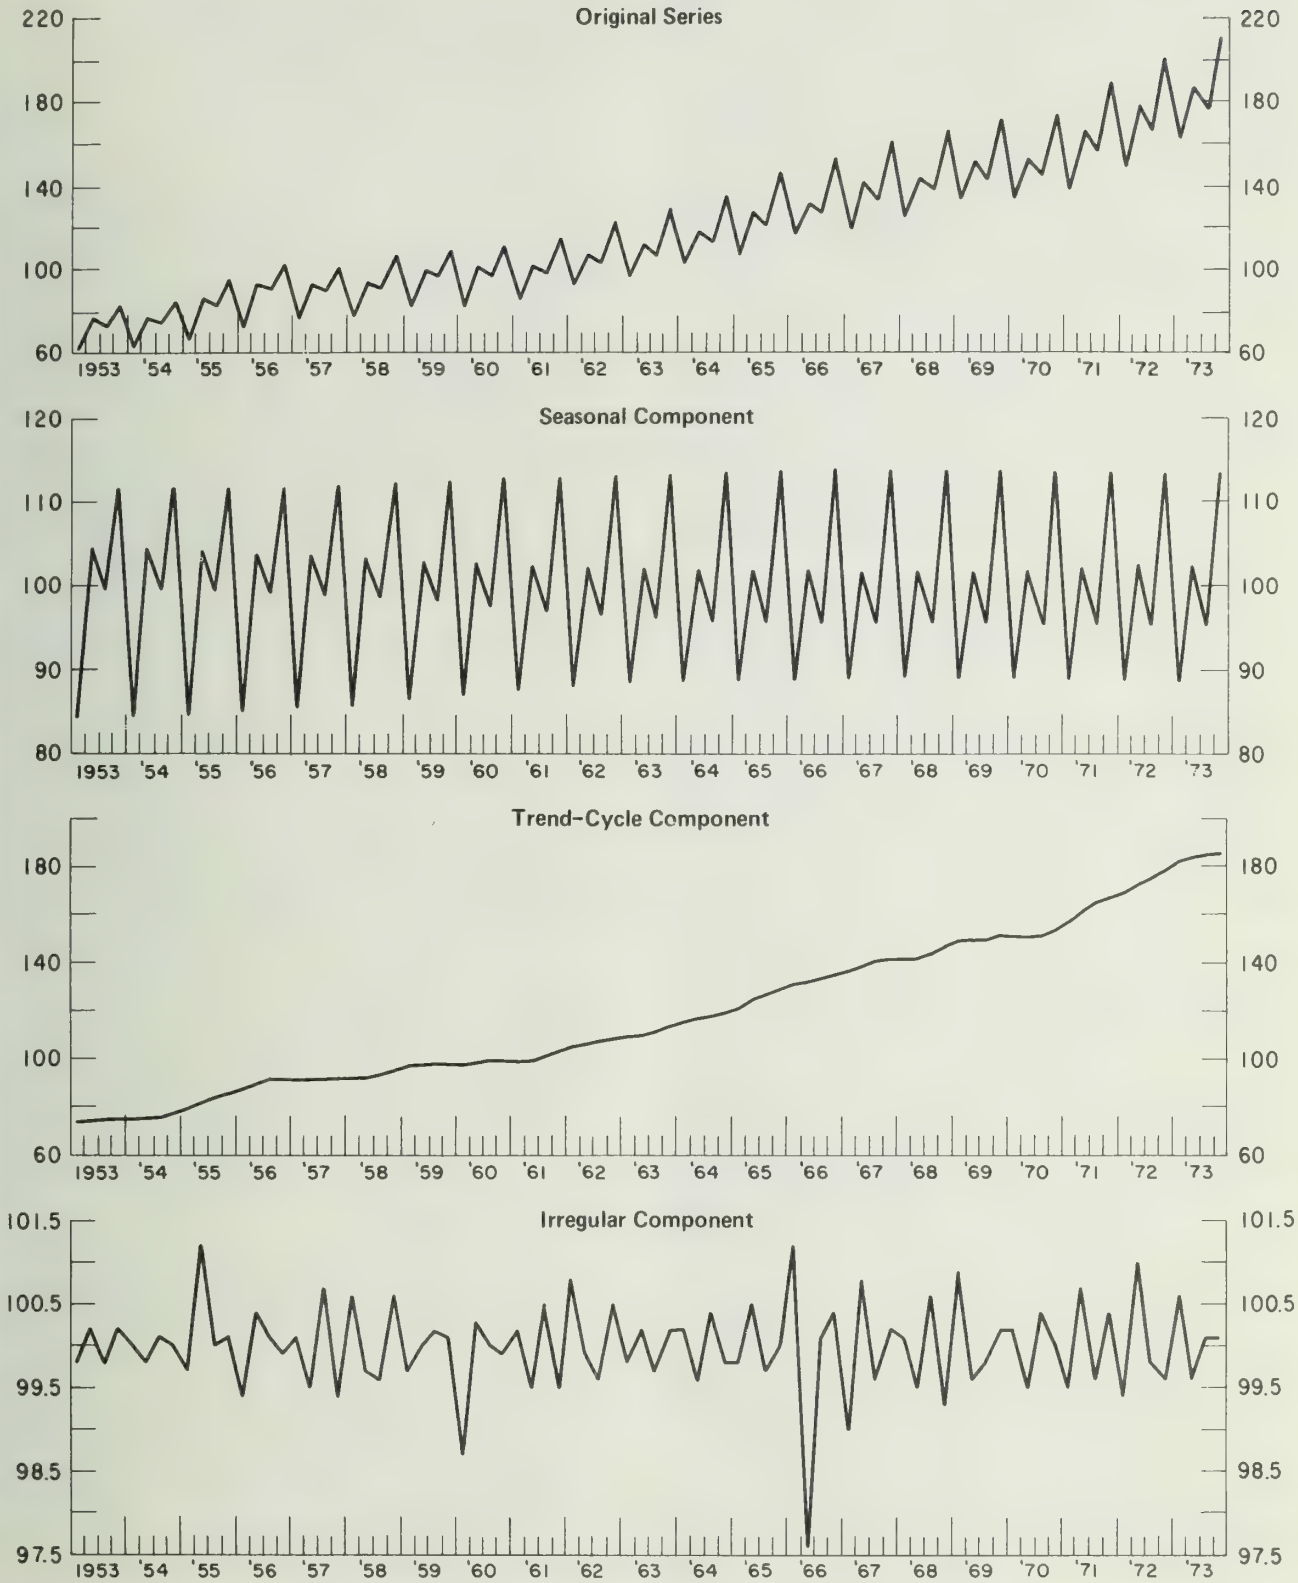

In much analytical work, the trend and the cycle are combined because, for series covering a short period of time, the trend is not so important. This rule, however, should not be followed blindly. There are cases in which the trend might be very noticeable even over

[1] "Well-behaved" in this sense means free from extreme variations.

[2] Pannekoek, A., *A History of Astronomy*, Interscience, New York, 1961.

Figure 1

Real Domestic Product — Retail Trade, 1953-73

short periods; for example, in series such as air line traffic, the number of long distance telephone calls or automobile production.

The seasonal variations represent the composite effect of climatic and institutional factors which repeat with certain regularity within the year. A more restricted and essentially empirical definition considers the seasonal variations "as the regularly recurring net influences of the climatic and conventional seasons in successive years on the rate of activity in specified sub-annual periods such as weeks, months, quarters, or half years".[3] Defined in this way, seasonal variation can be measured with relatively simple techniques. All that is necessary is to specify the sub-annual periods between which potential differences in seasonal behaviour are assumed to exist, but within which seasonal influences are assumed to be homogeneous.

Most economic time series contain significant seasonality. For example, agricultural production increases steadily each year from early spring to fall and then drops sharply: some series, such as stock market prices, have no seasonality. Seasonality in economic activity is particularly strong in Canada, because of our extremes in climate.

The random component of a time series represents those irregular variations which are unforeseeable movements related to events of all kinds. In general, the irregular component has a stable random appearance but, in some series, some extreme movements may be included. These extreme movements have identifiable causes (for example, floods, severe winters, strikes) and can therefore be distinguished from the much smaller random irregular variations.

There is no important economic series which shows only trend, or only cyclical movements, or only seasonal movements, or only irregular movements. The four components are inter-related and for most economic series, they influence one another.

Traditionally, the decomposition of a time series into its components has been done either by the ratio to moving averages technique (assuming multiplicative relationships or a multiplicative model) or by the difference to moving averages technique (assuming additive relationships or an additive model). In the former case, it is assumed that there is dependence among the components; whereas, in the latter case, it is assumed that there is independence among the components. It is always possible, however, to change a multiplicative relationship into an additive one, by use of a logarithmic transformation and reciprocally, to change an additive composition to a multiplicative one, using an exponential transformation. It should be borne in mind, however, that transforming the relationship among the components also changes the basic assumptions of the original model.

Figure 1 shows the estimated components of a time series on Real Domestic Product, Retail Trade, obtained with U.S. Bureau of the Census Method II X-11 variant.[4] In this method of seasonal adjustment, the trend and the cycle are combined.

The Meaning and Purpose of Seasonal Adjustment

There always has been a general awareness of the broad timing of seasonal changes. The seasonal movements in agriculture, the high pre-Easter and pre-Christmas retail sales, the low level of winter construction are all general knowledge. The influence of seasons in the level of the economic activity was noticed even in the nineteenth century when British bankers arguing against the Bank Reform Act of 1844 pointed out seasonal fluctuations in the circulation of bank notes.[5] Ever since that time, actuaries and statisticians have been actively engaged in developing techniques for the seasonal adjustment of economic time series.

Seasonal adjustment means removing the seasonal variations (and identifiable irregulars, when present) from the raw data, thus leaving a seasonally adjusted series consisting of the remaining components – the trend-cycle and the "well-behaved" irregular. The seasonal adjustment of a series provides more precise information on the timing and magnitude of seasonal changes affecting the level of the economic activity for all the sub-annual periods for which the series has been recorded (weeks, months, quarters, etc.).

The development of electronic computers has allowed the seasonal adjustment of a large number of series quickly and at relatively low costs. Today, most countries are able to publish many series in both unadjusted and in seasonally adjusted forms. As stated previously, the reason for publishing both is not because one is more correct than the other but because each has its uses.

The information given by seasonally adjusted series plays a very important role in the analysis of current economic conditions, particularly in determining the stage of the business cycle at which the economy

stands. Such knowledge is useful in forecasting subsequent cyclical movements and provides the basis for decision-making to control the level of the economic activity.

This knowledge is of greatest importance around the turning points in the business cycle. For example, failure to recognize the upturn in the cycle (indicating the beginning of the recovery period) may lead to the adoption of policies to curb recession when, in fact, an expansion is already under way.

In the absence of seasonally adjusted data, analysts who wish to get a picture of the economic situation not distorted by exogenous variables related to seasonal variations may make comparisons with the same month of the year before. However, apart from other considerations, the basic problem with same-month-year-ago comparisons is that they show only what has happened after 12 months, not what has been happening during the 12 months nor what is happening currently.

To evaluate the current state of the economy, the analyst should be able to measure cyclical changes for each month over less than a one-year span; for example, to compare May with April (one-month span) or May with February (three-month span). Comparisons of this sort made with unadjusted series give a distorted picture of the current economic situation, since, for series with significant seasonality, the average absolute month-to-month (quarter-to-quarter, etc.) percentage changes in the seasonal variation can be much greater than the corresponding changes in the irregular or in the trend-cycle. Results of several studies of selected economic indicators for Canada and the United States show that the average absolute month-to-month (quarter-to-quarter) percentage changes in the seasonal component run between three and seven times the average absolute percentage changes in the trend cycle or in the irregular over the same time spans.[6],[7]

The seasonal adjustment of a series removes only the seasonal variation and, therefore, comparisons of consecutive months give a measure of the changes in both the trend-cycle and the irregular. To be sure that the changes being measured are changes mostly due to cyclical fluctuations and not to irregularities, the average absolute month-to-month (quarter-to-quarter) percentage changes in the trend-cycle must be greater than those of the corresponding irregular. For the **historical** part of the series, this information is provided by the MCD statistics (Months for Cyclical Dominance) produced by the Census Method II X-11 variant. The MCD indicates the number of months span over which, on average, the changes in the trend-cycle component exceed those of the irregular component. The calculation of the MCD requires the seasonal adjustment of the series, and then the break down of the seasonally adjusted series into estimates of the trend-cycle and the irregular. The basic assumption in the calculation of the MCD is that the average monthly amplitude of the irregular remains about the same regardless of the span of months between the two months being compared; that is, that the average monthly change of the irregular component is about the same when computed for a one-month span (May and June), or a two-month span (May and March), or a three-month span (May and February), etc. On the other hand, the trend-cycle component accumulates continuously in one direction as the span increases, for periods usually lasting six months or more. For some series, the average change in the irregular factor could be smaller than that in the trend-cycle for a one-month span; then, the MCD is one (and month-to-month comparisons are possible). For most of the series, however, the time span must be greater before changes in the trend-cycle dominate changes in the irregular. When the MCD is six or more, the size of the irregular component is very large in relation to the trend-cycle.

The irregularities in the current observations of series are usually greater than those existing in historical data. Preliminary estimates of the raw[8] data and of the seasonal factor forecasts frequently are not up to established standards of accuracy and are the main sources of error. For some important indicators of the United States, it has been found that, on the average, there is about twice as much irregularity in current observations as is indicated by the MCD statistics. (See footnote 7.) To take these factors into consideration, Shiskin (1973) has proposed a new statistic, more useful for current observations than the MCD, called the MSD (Months for Signal Dominance). This MSD measures the number of months required for the average percentage changes of the **signal** (the trend-cycle) to dominate the average percentage changes of the **noise** (the average month-to-month change in a seasonally adjusted series arising from revisions in raw data and in seasonal factors, plus average change in the historical irregular component). The MSD has not been incorporated into the Census Method II X-11 program; however, studies show that, for many series, the MSD is one or two months longer than the span indicated by the MCD. For the comparisons of current figures of seasonally adjusted series, therefore, it would be more appropriate to use the MSD statistics. In general, we cannot tell from the latest estimate of a seasonally adjusted series whether the trend-cycle is rising or falling between the latest two months for which data are available, but we can determine the direction by comparing the observation for the current month with another about three

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. [1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitioners. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars / the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are fected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter ovements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of ice change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. [4]The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source see Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

[1]In calculating time loss, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers: the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, they also will be shown in the total. [3]Includes miscellaneous manufacturing industries. [4]Includes also publishing and allied industries. [5]Includes also the storage and communication industries. **Source: Labour Gazette, Department of Labour.**

[1] The data for Tables 2 to 5 are based on reports from establishments employing 20 persons or more at any time of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]Excludes agriculture, fishing, trapping and public administration and defence. [3]Includes storage, electric power, gas and water utilities. [4]Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. Excludes agriculture, fishing, trapping, non commercial services, plywood households, public administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]See footnote 1 and source in Table 9. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 8. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data for the current year are subject to revision. [2]Includes gold. [3]Consists of general wholesale index less animal products and vegetable products component groups. [4]Consists of iron products and non-ferrous metals products component groups less gold. [5]These two series comprise the general wholesale index. [6]Excludes gold. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1]Indexes prior to May 1973 incorporate 1957 expenditure weights (1964 for Quebec City and Thunder Bay), those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2]The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3]Includes constant weighted food component. [4]These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C. P. I. major components from May 1973 forward. [5]Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

annual average and month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month						ratio of inventories owned to shipments
				owned[3]	held but not owned	all inventory held: total	raw materials	goods in process	finished products

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

Table 2: manufacturing shipments[1] by industry based on the 1970 standard industrial classification (million dollars)

annual average		total shipments	durable	durable	foods and beverages	[illegible] products	rubber	leather	textile	knitting mills	clothing	wood

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended for cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.**

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1]Includes crude oil, condensate and pentanes plus. [2]Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. [3]Gross new production by field less field flared and waste. [4]By gas utilities, **does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D.B.S.**

Table 5: statistics of refined petroleum products[1] (thousand barrels)

year and month	total refinery receipts[2]	production of saleable products[3]: total, all products	motor gasoline	heavy fuel oil	diesel fuel oil	light fuel oil[6]	aviation fuel[7]	asphalt	liquefied petroleum gases[8]	other products	net sales in Canada[4]: total all products	motor gasoline	heavy fuel oil	diesel fuel oil

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]The data are collected for 1,400 municipalities and individual figures are available on request. [2]Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William-Port Arthur to form Thunder Bay. **Source: Building Permits (64-001), Statistics Canada.**

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.. Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property. **Source: Canadian Housing Statistics, Central Mortgage and Housing Corporation.**

[1]Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P. E. I. [2]Shipments by principal manufacturers. Total domestic shipments are somewhat higher. [3]Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [4]Building contractors, public and utility construction and structural steel fabricators.

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines given in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above total covers all farm implements and machines sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. For these groups sales are by users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to revision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Monthly totals for current years are not equivalent to annual data due to receipt of additionnal statistics which cannot be allocated by months. [2]Includes also seaweeds and other species such as whales, worms etc. [3]Exports include sea and freshwater fish and shellfish products but exclude bait, meal, oils, offal, livers, fish roe n.e.s. and fishery foods and feeds n.e.s. [4]Total holdings (all forms) of frozen fish commencing october 1969 excludes freshwater species.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7]The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories. **Source: Retail Trade (63-005), Statistics Canada.**

Note: Components may not add to totals due to rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortgages home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans and bills owing to doctors, dentists, lawyers, and other personal service credit as they are not available. [2]Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. [3]Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. Starting with January 1970 this series affected by transfer of passenger cars financed for commercial purposes from consumer goods to commercial goods; from January 1971 amounts shown exclude unearned finance charges: for December 1970 this change had the effect of reducing the gross figure by 13.5 per cent. [4]Personal cash loans of up to $1,500. made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [5]Personal cash loans of over $1,500. usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. [6]The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. [7]Till December 1970 data for only Oil Companies. From first quarter 1971 figures include statistics for transportation and travel and entertainment card-issuing companies. For seasonal adjustment purposes seasonal factors for oil company credit cards were used to adjust the new series other credit card issuers on the assumption that the two series are subject to the same seasonal effects. [8]Bills due for residential/domestic use of telephones, gas and electric power. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, and Dept. of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

Year and month	total railway revenue freight (loaded and non-carload) ('000 tons)		total revenue cars loaded (carload only)	farm products and food						mine products			
	unadj.	S.A.		wheat	other grain and grain products	fresh fruits and vegetables	other agriculture products	animals and their products	prepared food products	iron ore and concentrates	other metal ores and concentrates	potash[2]	coal, sand, cement and other mine products

[1]Prior to 1970, figures included the operations of scheduled Canadian air carriers. Beginning with 1970, figures include the operations of the seven largest rlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair id Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. Note that Nordair is cluded prior to 1970. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) atistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Total of foreign funds, short term foreign investments, and other foreign currency assets less foreign currency liabilities. [7]Excluding Canadian day-to-day loans. [8]Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [9]Loans to grain dealers and exporters. [10]Loans to finance purchase of Canada Savings Bonds at time of issue. [11]Including loans to instalment finance companies. [12]These series reflect the combination of two CANSIM series.

Note: Components may not add to totals due to partial revisions.
[1]End of period. [2]Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3]Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4]Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. [5]Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6]Allowance for the take-over of Nova Scotia Light & Power common shares. **Source: Bank of Canada Review.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries except electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1]The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. [2]In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. **Source: Commercial Failures (61-002) Quarterly, Statistics Canada.**

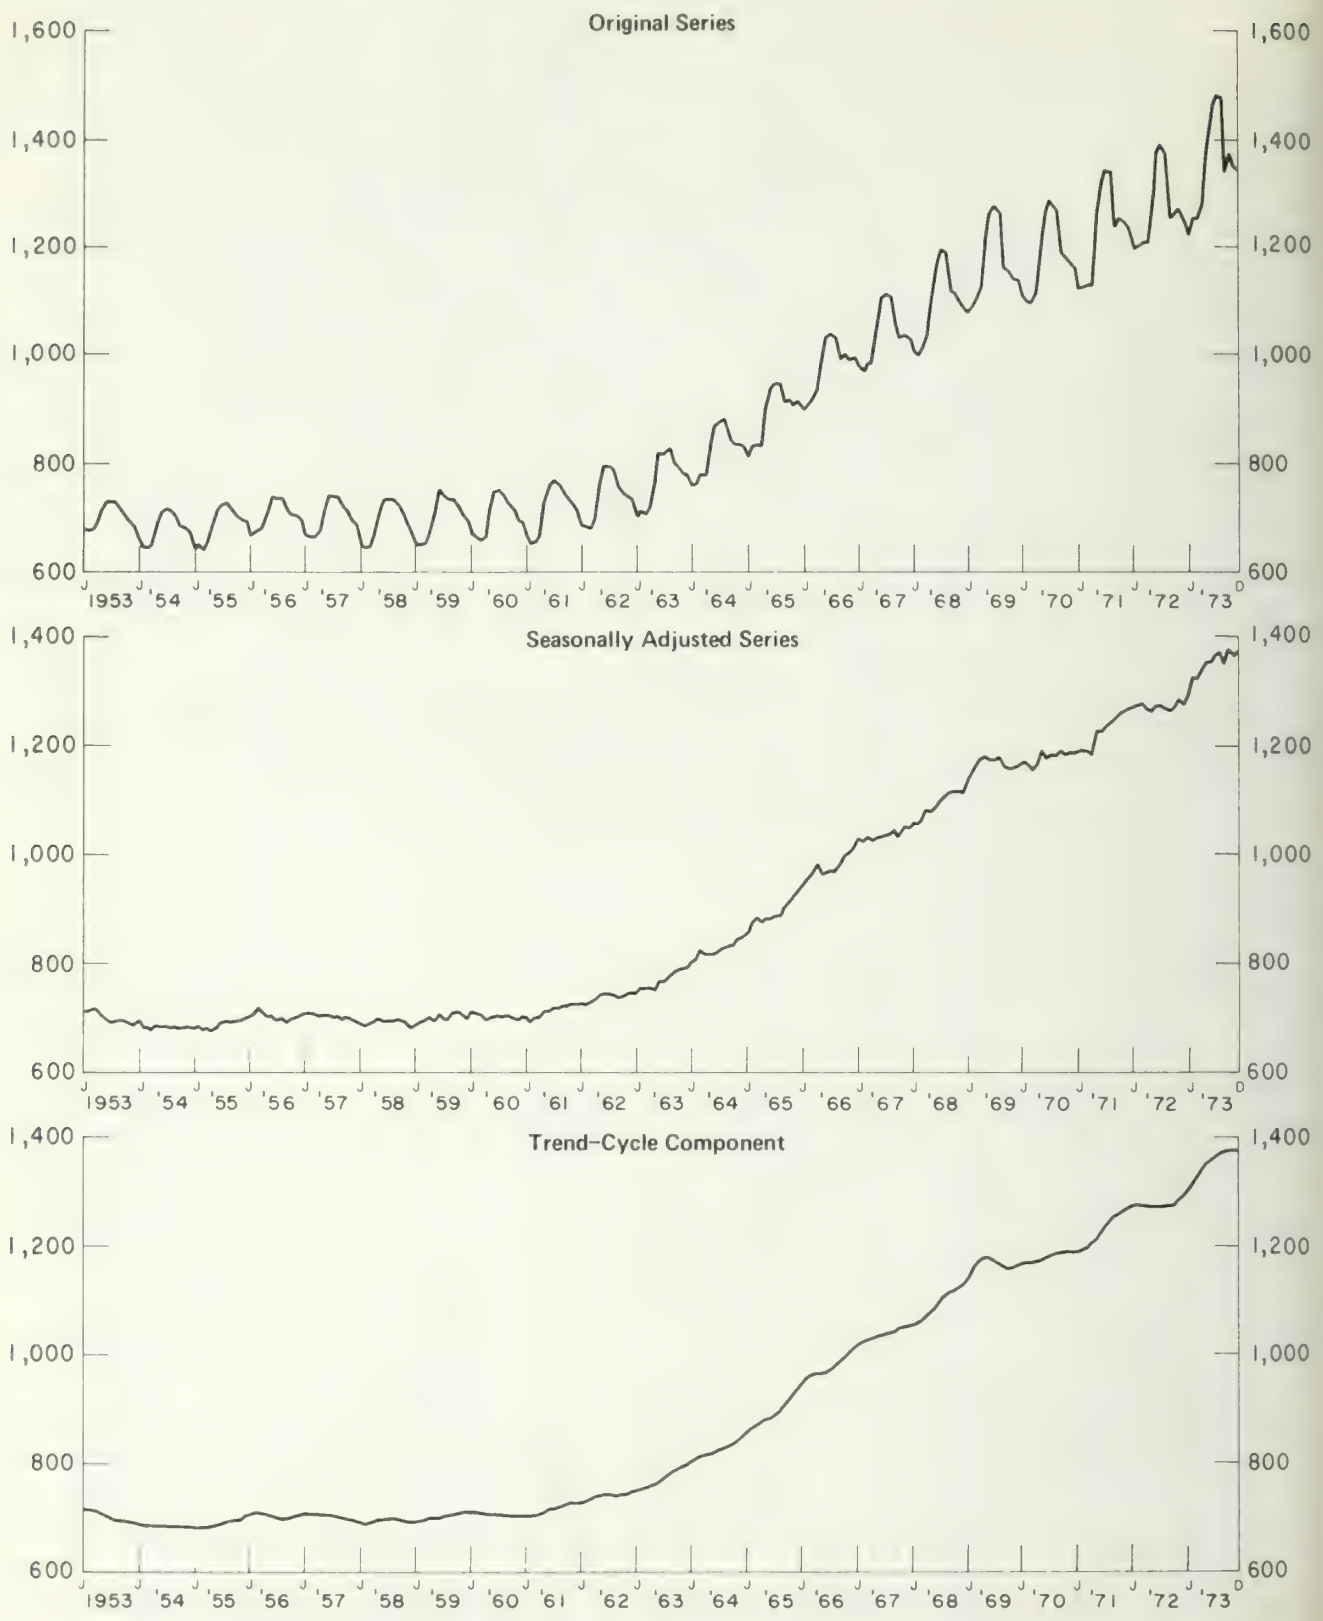

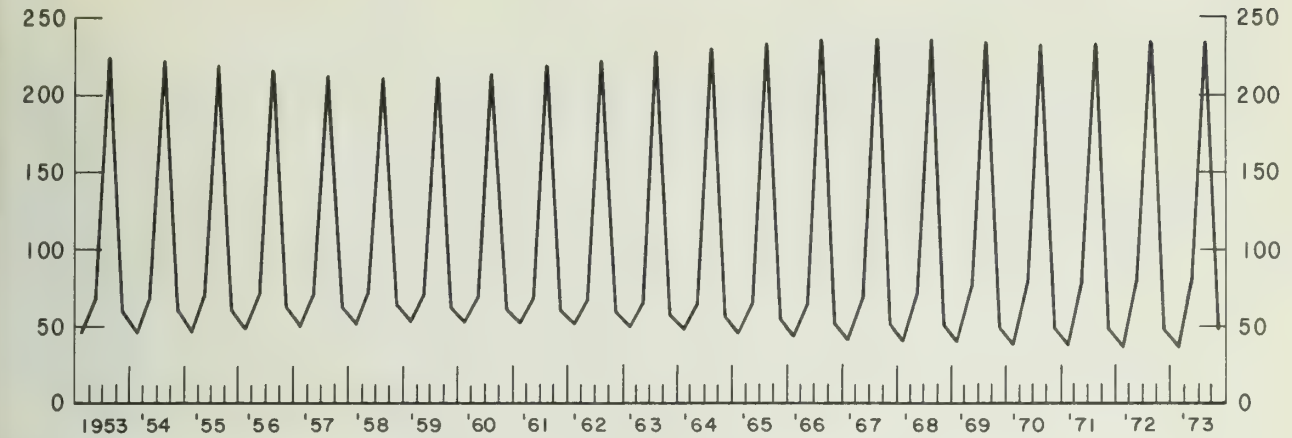

Figure 3

Real Domestic Product – Agriculture, 1953-73

Seasonal Component

months earlier. In spite of this limitation, the use of seasonally adjusted data still gives policy makers information about the economy much earlier than the use of unadjusted series.

Figure 2 shows Employed, Both Sexes, 20-24, Canada, series from 1953-73, in its original form, the seasonally adjusted series and the trend-cycle component. It is clear from the chart that movements are easier to follow by looking at the seasonally adjusted series than by looking at the unadjusted data. Since the MCD is two, changes in the level of the series due to strictly economic causes can be measured only by comparing the estimates of the trend-cycle that are two or more months apart. For current year observations, where we expect more noise (greater irregularity) to be present, the comparisons must be made over longer time spans than indicated by the MCD statistics, usually one or two months longer.

Stable and Moving Seasonality

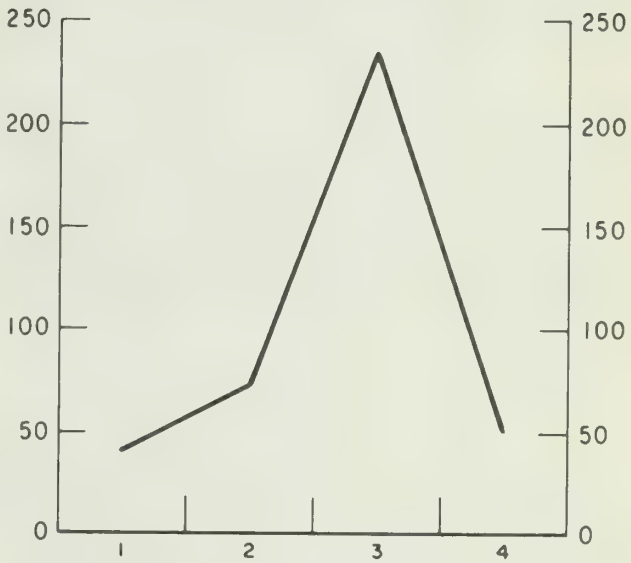

The components of a time series are not observable, and consequently, any method of estimation of the trend-cycle, the seasonal variation and the irregular, requires *a priori* assumptions regarding the types of functions that describe the evolution of each component through time.

Several types of models have been built to describe the behaviour of the seasonal component. They can be grouped into two main categories: (1) those assuming stable seasonality, and (2) those assuming moving seasonality.

The seasonal variation is said to be stable if it can be represented by a strictly periodic function with a periodicity of one year. For a monthly series, in an additive model, this implies that the seasonals are 12

Figure 4

Seasonal Pattern, 1968

constants adding to zero from any time origin. (In a multiplicative model, the constant seasonal factors add to 1,200.)

Figure 3 shows the seasonal factors of a series on Real Domestic Product of Agriculture, 1953-73. Here, the pattern of the seasonality is very stable and the seasonal factors for each quarter are almost the same.

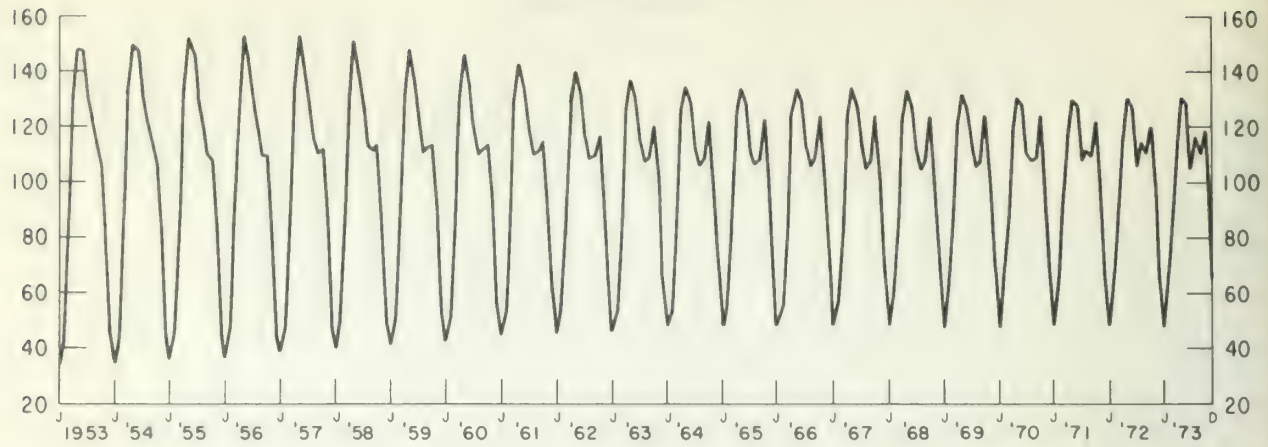

Figure 4 shows the typical shape of the seasonal component for 1968 which is almost the same for all the years.

For most economic time series, however, either the amplitude or the shape of the seasonal pattern or both change through time. In such cases, the series is said to have moving seasonality.

Figure 5

Building Permits by Types, Residential, 1953-73

Seasonal Component

Moving seasonality may be time conditioned (that is, arising from the impact of technological, climatological or institutional changes) or trend-cycle conditioned (that is, determined by the level of the trend-cycle at any moment of time). (See footnote3.)

When moving seasonality is present, the seasonal factors for each month are no longer constants but follow a systematic pattern (usually assumed to be a linear pattern). Seasonal adjustment techniques (including the Census Method II X-11 variant) assume that the seasonal movements are smooth; that is, that seasonal changes are gradual with only occasional reversals in direction. Figure 5 illustrates a case of moving seasonality.

Seasonal Factor Forecasts and Revisions

It is common practice to forecast seasonal factors one year ahead for use in seasonally adjusting current observations as they become available. There is no problem of forecasting when the seasonal variation is stable but, unfortunately, very few economic series fulfill this assumption. When the seasonality is changing, as happens in most cases, optimal estimates of the seasonal factors for the current year cannot be made until a few years later.

A series is usually readjusted when all observations for the current year become available and, as a general rule, both the forecasted seasonal factors and the factors for earlier years change. These changes, which are the differences between the corresponding factors for the current adjustment and the previous adjustment, can be significantly large.

Frequent revisions create difficulties for users of the data, to a point where some may even come to doubt the value of the seasonal adjustment. Revisions are justified when the newly available data clearly indicate that a change has taken place in the behaviour of the seasonal pattern or when assumptions made on the basis of previous data are shown to be incorrect. However, revisions should be kept to a minimum when they arise simply from the inclusion of new figures as such; that is, when the new information is consistent with the conclusions reached on the basis of earlier figures.

Title and Description

F *Revue Statistique du Canada*, mensuel.
This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

Weekly Supplement to the Canadian Statistical Review—Free to *Canadian Statistical Review* subscribers.

Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).

Annual Supplement to the Canadian Statistical Review—Price $1.40 (Free to *Canadian Statistical Review* subscribers.)

Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).

Canadian Statistical Review—Historical Summary 1970, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers)

This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

Title and Description

CANSIM Manuals and other Publications (Cont'd)

*12–530 *CANSIM: Operational Manual for Data Entry* (Occasional)—Price $1.40

This manual will be of practical interest only to federal government agencies which store and maintain time series in the CANSIM data base. Users desiring a fuller knowledge of the codes used and the storage methodology will find this volume a useful companion to the Retrieval manual. (Available in French, catalogue no. 12-530F.)

*12–531 *CANSIM: Users Manual for Data Retrieval and Manipulation* (Occasional) 1973 edition—Price $2.10

Gives detailed instructions on procedures for obtaining data from the CANSIM data base. The new edition reflects enlargement and improvement of the retrieval package. (Available in French, catalogue no. 12-531F.)

— CANSIM: *Summary Reference Index* (Annual, with periodic amendments) 1973 edition—Free on request.
This index summarizes data available from CANSIM and provides matrix identifiers.
Order by title from General Time Series Staff.

— CANSIM: *Series Directory* (Annual, with periodic amendments) 1973 edition—Price $15.00, or $20.00 with amendment service.

The CANSIM *Series Directory* contains matrix and series titles and descriptive detail for series available from CANSIM. It is used in conjunction with the *Summary Reference Index* and CANSIM *Manual for Data Retrieval and Manipulation* (12-531) to order series from Stastitics Canada.
Order by title from General Time Series Staff.

This Review, the above and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General of Canada. For further information direct inquiries to:

General Time Series Staff,
Statistics Canada,
Ottawa, K1A 0T6.

ndments to catalogue numbers 12-530 and 12-531 will be issued periodically and will be available from the Publications Distribution, ics Canada.

Statistics Canada Statistique Canada

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, nº du catalogue 11-003F.

Series published in this Review are available on print-outs or from CANSIM, the computerized time series data bank of Statistics Canada, in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The data in the base may therefore be more timely than data on the CSR tape. For additional information see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variance.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

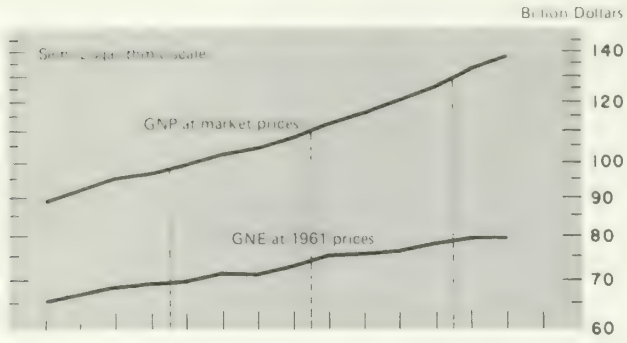

Section 12, Table 2 – Operating Statistics of Canadian Railways

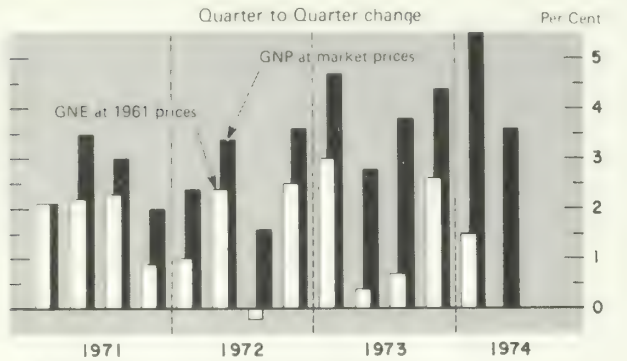

The series "Revenue Tons Carried" (D 4018) and "Revenue Passengers Carried" (D 4020) were terminated in December 1972, and have been removed from the table with this issue.

Section 13, Table 2 – Canadian chartered banks

Data on "net foreign currency assets" (B 611) have been deleted from the *Canadian Statistical Review* and from CANSIM. Therefore, the summary figure "total Canadian and net foreign assets" (B 600), has also been deleted and replaced with "total Canadian dollar assets" (B 670).

Second quarter GNP at market prices rose to $137.6 billion, an increase of 3.6 per cent. GNE in real terms remained unchanged in the quarter.

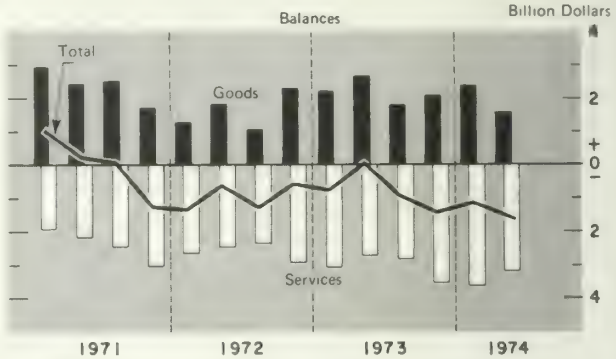

Labour income increased substantially, but at a rate below the unusually high rates of the preceding two quarters. Farm income increased at a rate well above that of the first quarter, while corporation profits and net income of unincorporated business maintained their rates of growth.

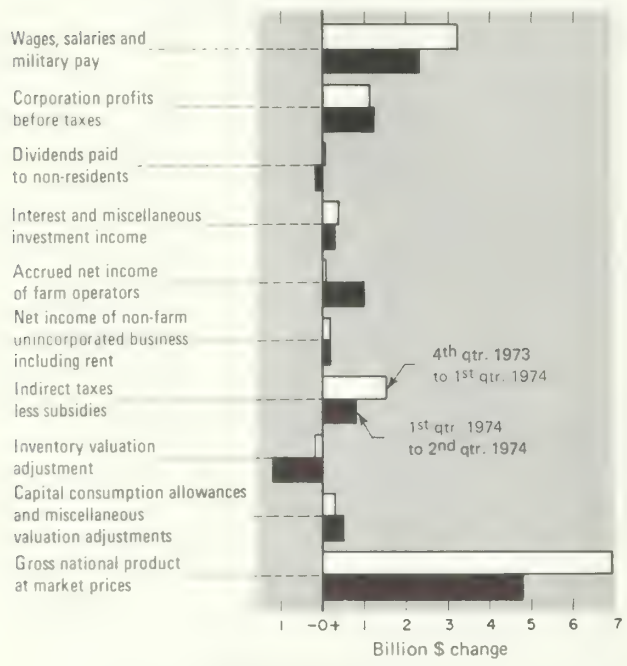

In current dollars, there was a deterioration in the overall deficit, which stood at $1,148 million in the first quarter, to $1,580 million in the second quarter. A decline in the merchandise trade surplus accounted for the widening of the overall deficit.

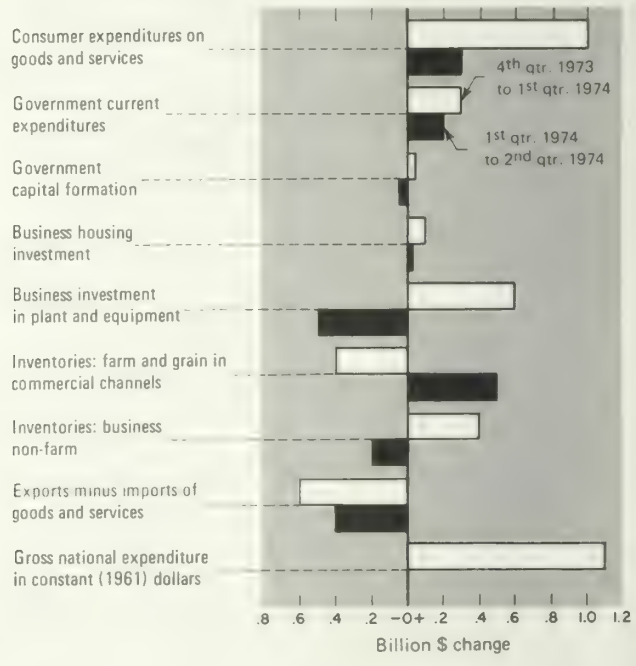

There was also a general weakness in all components of final domestic demand, particularly in business gross fixed capital formation. As in the first quarter, extraordinary price increases were a dominant feature.

Quarterly changes in GNP and components

All data seasonally adjusted and at annual rates.

Quarterly changes in GNE and components in constant (1961) dollars

NATIONAL INCOME AND EXPENDITURE ACCOUNTS
Second Quarter 1974

Introductory Review

Preliminary estimates of the National Income and Expenditure Accounts for the second quarter of 1974 indicate that the Canadian economy may have entered a period of weakness common to industrialized nations of the world. As in the first quarter, extraordinary price increases were a dominant feature. Final domestic demand in real terms showed little change from the first quarter level, reflecting weakness in all major components. Softening in the external sector was the result of a decline of close to 4 per cent in the volume of exports of goods and services that was more than twice the decline in imports. Despite the widespread slowdown in demand, employment increased moderately from the first quarter, and with little growth in the labour force, the unemployment rate for the second quarter was reduced to 5.2 per cent from 5.5 per cent in the first.

Second quarter Gross National Product, seasonally adjusted at annual rates, rose to $137.6 billion, an increase of 3.6 per cent following a revised first quarter increase of 5.5 per cent. The current dollar increase, however, came entirely from higher prices with the result that Gross National Expenditure in real terms remained unchanged in the quarter. The slower growth in current dollar personal expenditure coupled with price acceleration resulted in only a marginal increase in real terms. Against a background of remarkable price increases and strikes in the construction industry, gross fixed capital formation declined substantially in real terms. Based on the Mid-year Private and Public Investment Intentions Survey, the rate of housing construction necessary to fulfill annual expectations was exceeded in the first six months, while the poor performance of the non-residential construction sector in the second quarter may mean the possibility of some difficulty in meeting the annual level of intentions.

A notable aspect of demand in the current quarter was the third consecutive large quarterly accumulation of non-farm business inventories. Government current spending on goods and services in real terms was a source of strength in the quarter.

On the income side, labour income increased substantially over the previous quarter, but at a rate below the unusually high rates of the preceding two quarters, in part due to the effects of stikes in a number of industries, notably construction. Farm income increased at a rate well above that of the first quarter, while corporation profits and net income of unincorporated business maintained their rates of growth.

Consumer Outlays

Personal expenditure on goods and services rose $2.7 billion in the second quarter, accounting for more than one-half of the rise in Gross National Product. In percentage terms, the 3.5 per cent increase represented a deceleration from the strong rate of advance realized in the previous quarter, the deceleration occurring in all categories of goods. The implicit price indexes for all four categories of consumer expenditure increased at accelerating rates in the second quarter. The overall gain in real consumer spending was 0.6 per cent, compared with 2.0 per cent in the first quarter.

Second quarter expenditure on durable goods increased by 4.8 per cent, comprised of 2.2 per cent real growth and 2.5 per cent price increase. The current dollar increase included a 5.7 per cent rise in expenditures on automobiles, mainly on used cars; spending on recreation, and sporting and camping equipment accelerated; spending on household appliances decelerated; and spending on furniture declined. Price increases were widely spread and, in general, resembled those of the previous quarter.

Current dollar spending on semi-durables, such as clothing, footwear and household furnishings, increased by 4.5 per cent in the second quarter. Again, prices increased at about the same pace as the previous quarter, 2.9 per cent, leaving the volume increase at 1.5 per cent.

Virtually all of the 3.8 per cent increase in spending on non-durables was due to higher prices. Food price increases remained large, at 3.9 per cent compared with 3.2 per cent in the previous quarter. Real spending on food increased by 0.8 per cent. Increases in prices of electricity, gas and oil also accelerated strongly.

Spending on services was the only category of personal expenditure to show even modest acceleration in current dollar terms, rising from 2.2 per cent in the first quarter to 2.4 per cent in the second. Within this category, there was an increase in rent and lodging payments and in spending for personal care. Spending on travel-related services, such as hotels and restaurants, accelerated, as did their prices. Dental services and hospital care also registered healthy price increases.

Fixed Capital Formation

After five successive quarters of strong increases, particularly in the first quarter of 1974, business investment in fixed capital slowed to a 2.5 per cent rise in the second quarter. Strikes in the construction industry contributed significantly to this slowdown. The

lower rate of investment was accompanied by a surge in prices from 3.1 per cent in the first quarter to 5.7 in the second, resulting in a 3.0 per cent decline in real terms.

Residential construction rose by 8.3 per cent in value terms, but by less than 1 per cent in volume. The increase resulted from a large carry-over of work started in the first quarter, as there was a decline in starts in the second quarter. The carry-over consisted mainly of increased investment in singles, which offset a moderation in spending on multiples and apartments. A 7.5 per cent rise in housing prices, accounting for most of the value increase, was largely due to this shift. The price of singles rose much more rapidly than the prices of other types of dwellings.

The value of investment in non-residential construction displayed almost no change in the second quarter after advancing 9.8 per cent in the first quarter. In addition to the previously mentioned strikes in the industry, there were strong increases in the prices of labour and materials, especially metal and metal-based materials. Overall, the implicit price index for business investment in non-residential construction climbed 7.0 per cent during the quarter. In real terms, non-residential construction declined 7.1 per cent.

The slowdown in construction was accompanied by a 2.5 per cent decline in the volume of investment in machinery and equipment, after a very strong increase in the first quarter. Prices in this category of investment increased by a relatively moderate 3.4 per cent.

Inventory Investment

Non-farm busines inventory investment declined moderately in real terms from an accumulation of $1,660 in the revised first quarter to an accumulation of $1,476 million in the second, rates about double the accumulation of last year. Additions to stocks by manufacturers and wholesalers were the major source of accumulation. Stocks of manufacturers increased substantially at all levels of fabrication. Most of the durable and non-durable categories reflected increases, with the exception of transportation and petroleum products industries, where stocks were liquidated sharply. Within wholesale trade, about 80 per cent of the build-up took place in durables, especially in construction materials including wood. Stocks at the retail level increased only moderately despite a continuing decumulation in motor vehicle inventories and in most categories of non-durables.

The External Sector

There was a pronounced deceleration of the rate of increase in the value of both exports and imports which, after discounting price increases, resulted in substantial declines in real terms for both components. Despite rising 2.6 per cent in value, exports were down 3.7 per cent in real terms due to a 6.6 per cent price increase. For imports, the decrease was substantially less. The value of imports was up 3.7 per cent, but with a price increase of 5.4 per cent, a decline of 1.6 per cent in real terms was recorded.

Stated in current dollars, there was a deterioration in the overall deficit, which stood at $1,148 million in the first quarter, to $1,580 million in the second quarter. The merchandise trade surplus, which fell from $2,428 million in the first quarter to $1,604 million in the second, accounted for the widening of the overall deficit.

A decline occurred in most major categories of merchandise exports, notably in the motor vehicle and iron ore components, in both value and volume terms. There were increases in exports of wheat and auto parts. Although price increases were widespread, including a 23 per cent increase in petroleum, the overall rise of 7.0 per cent was less than the 10.7 per cent registered in the first quarter.

The decline in real merchandise imports was most pronounced in the food and beverage and crude materials components. The ban on imports of DES-fed cattle from the United States contributed significantly to the decline in food and beverage imports. Within crude materials, petroleum imports dropped substantially in volume terms. The volume of non-farm machinery and equipment imports declined, in line with the drop in domestic investment in that category. The overall price index of merchandise imports rose by 6.1 per cent in the quarter including a 38 per cent increase in petroleum prices.

Incomes

Turning to the income side, total labour income rose by 3.3 per cent in the second quarter of 1974, compared with 4.7 per cent in the first quarter. Time lost due to industrial disputes in the second quarter along with irregularly high retroactive payments and higher rates of employer contributions to various social security schemes in the first quarter were major factors in the deceleration in the rate of growth. With employment increasing only slightly, most of the increase in the second quarter was due to increased average earnings.

Wages and salaries in the goods-producing industries rose by 1.9 per cent, after a 4.0 per cent gain in the first quarter. This deceleration was concentrated in the forestry and construction industries and was largely due to industrial disputes. Wages and salaries in the manufacturing industry rose by 3.5 per cent, slightly higher than the first quarter rate. Most of the advance in this industry was attributable to a higher earnings component as employment increased only slightly.

Wages and salaries in the service-producing industries increased by 4.0 per cent, compared with 4.5 per cent in the first quarter. The rate of growth in wages and salaries of the transportation, communication and other utilities industries decelerated sharply, from 8.5 per cent in the first quarter, when large retroactive payments were made, to 1.5 per cent in the second quarter. The other service-producing industries all registered larger gains in the second quarter than in the first quarter; these gains reflected mainly higher average earnings.

Corporation profits before taxes, seasonally adjusted, continued to show substantial growth in the second quarter of 1974, with preliminary estimates indicating a rise of 7.0 per cent following a 6.6 per cent increase in the first quarter. Within the manufacturing group, preliminary data indicate that textiles, primary metals, transportation equipment, electrical products and petroleum and coal made the largest gains. Mining profits also appear to have increased substantially.

As in previous quarters, a significant part of the rise in corporation profits and in non-farm unincorporated business income was due to inventory gains resulting from the turnover of goods at rising prices. The inventory valuation adjustment, intended to remove from income those profits which do not reflect current production, rose very sharply. The petroleum and coal products industry in manufacturing, the petroleum bulk tank stations category in wholesale trade, and the mining industry combined accounted for about 25 per cent of the second quarter inventory valuation adjustment.

Estimates of accrued net income of farm operators from farm production increased substantially in the second quarter, to reach a rate of $4,916 million, reflecting a sharp increase in the earnings of the Canadian Wheat Board. Estimates of the value of livestock production indicate a levelling out at the very high rate established in 1973.

TABLE 1. National Income and Gross National Product, by Quarters, 1973 and 1974

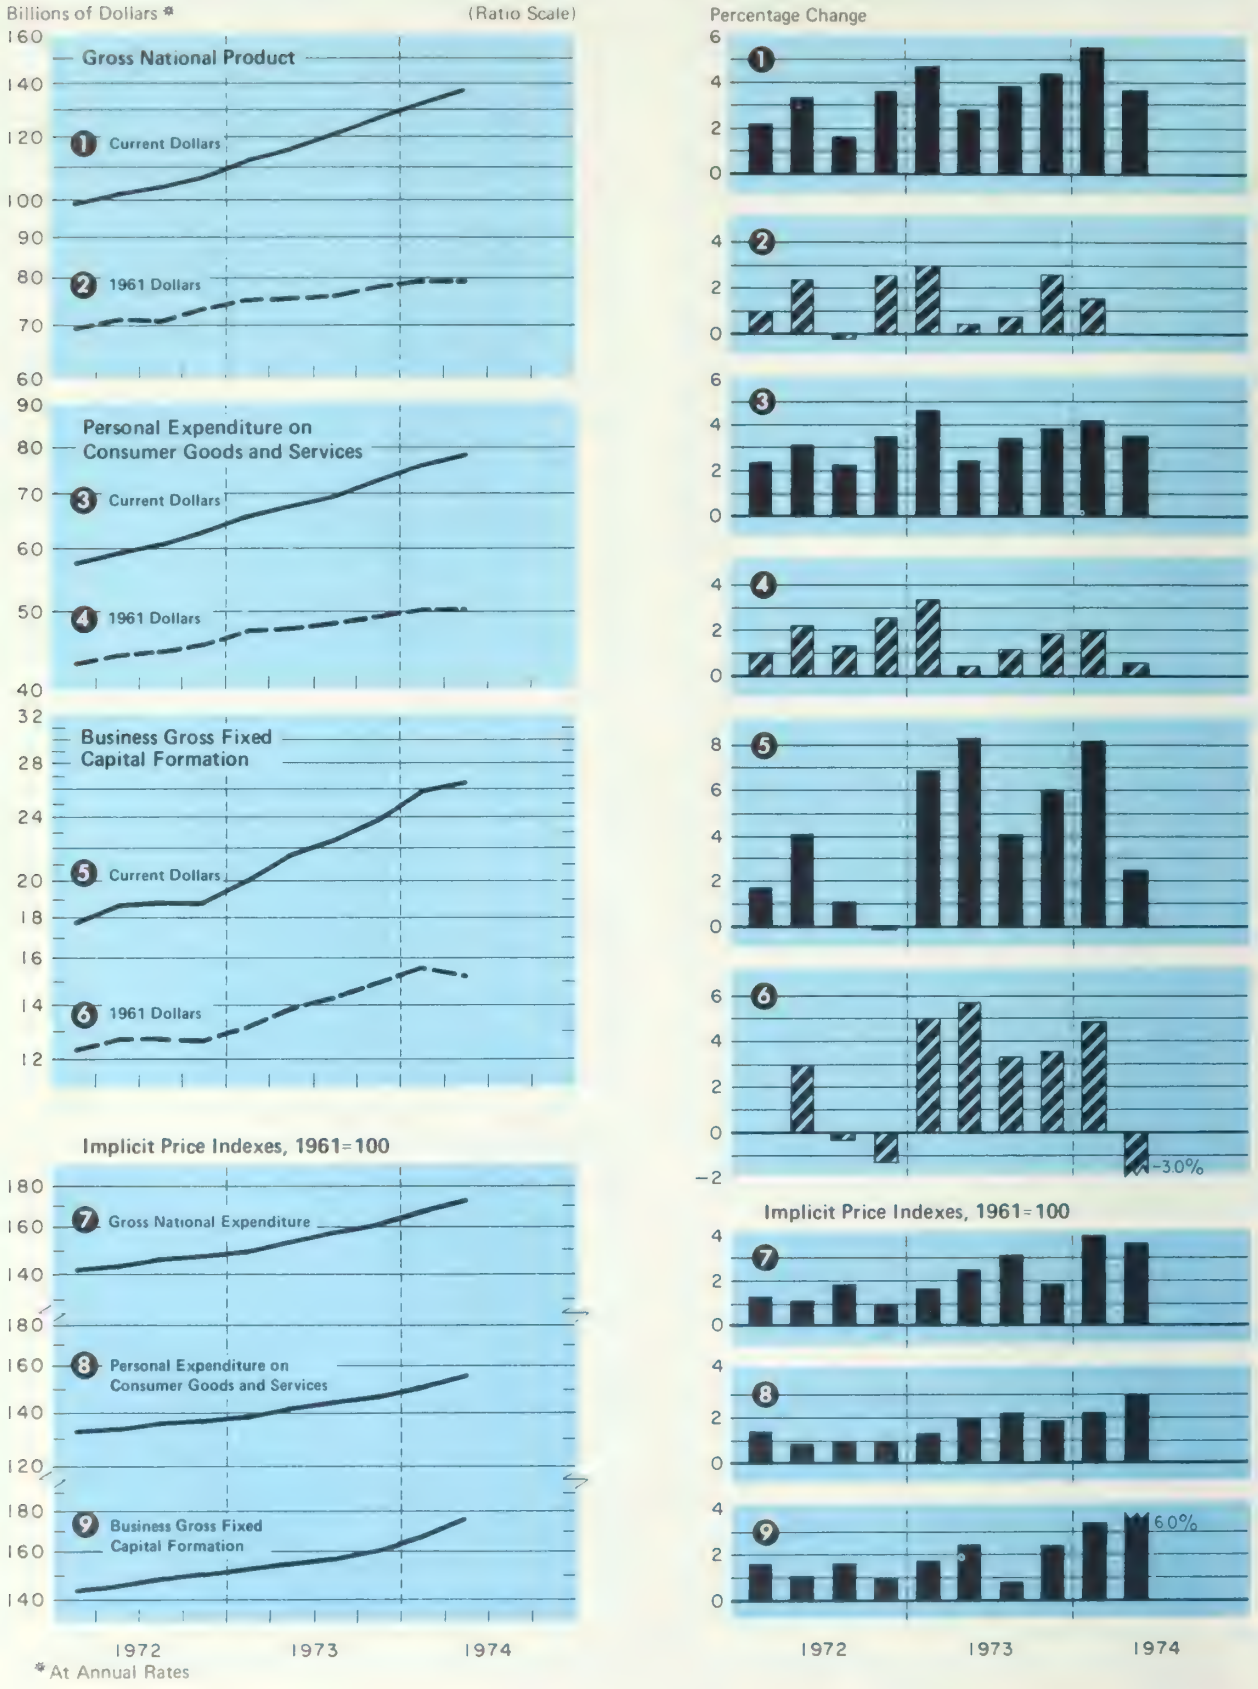

Seasonally adjusted at annual rates

	1973					1974

1 Excludes profits of government business enterprises.
2 Includes the withholding tax applicable to this item.
3 Includes profits (net of losses) of government business enterprises and other government investment income.
4 Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the change in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.
5 Includes net income of independent professional practitioners.
6 See footnote 4, of Table 2.

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. [1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitioners. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are fected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter ovements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of ice change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are eated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of ie treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have een generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source ee Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

Table 2.3: industrial production,[1] volume indexes (1961 = 100), based on the 1960 standard industrial classification

year and month	index of industrial production	mines (including milling), quarries and oil wells									manufacturing					
			metal mines				mineral fuels			non-metals except coal			non-durables			
				placer gold mines & gold quartz mines	iron	misc. metal mines, n.e.s.		coal	crude petroleum and natural gas		asbestos			foods and beverages		
		total	total				total			total		total	total	total	meat products	dairy products

Table 2.3: industrial production, volume indexes (1961 = 100), based on the 1960 standard industrial classification – continued

year and month	durable manufacturing															
	primary metal industries					metal fabricating (ex mach. & transportation equipment)							machinery (except electrical)	transp. equipment		
	total	iron & steel mills	steel pipe & tube mills	iron foundries	smelting and refining	total	boiler & plate works	fabricated structural metal	ornamental & architectural metal	metal stamping, pressing & coating	wire & wire products	hardware, tool & cutlery		total	aircraft and parts	motor vehicles[1]
	1961 industry weights

[1]The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

[1]In calculating time loss, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers: the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, they also will be shown in the total. [3]Includes miscellaneous manufacturing industries. [4]Includes also publishing and allied industries. [5]Includes also the storage and communication industries. **Source: Labour Gazette, Department of Labour.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3]Includes storage, electric power, gas and water utilities. [4]Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. Excludes agriculture, fishing, trapping, non commercial services, plywood households, public administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]See footnote 1 and source in Table 9. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 8. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data for the current year are subject to revision. [2]Includes gold. [3]Consists of general wholesale index less animal products and vegetable products component groups. [4]Consists of iron products and non-ferrous metals products component groups less gold. [5]These two series comprise the general wholesale index. [6]Excludes gold. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1]Indexes prior to May 1973 incorporate 1957 expenditure weights (1964 for Quebec City and Thunder Bay), those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2]The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3]Includes constant weighted food component. [4]These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C.P.I. major components from May 1973 forward. [5]Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

annual average and month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month: owned[3]	inventory at end of month: held but not owned	inventory at end of month: all inventory held: total	all inventory held: raw materials	all inventory held: goods in process	all inventory held: finished products	ratio of inventories owned to shipments

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

Table 2: manufacturing shipments[1] by industry based on the 1970 standard industrial classification (million dollars)

annual average	total shipments	non-durable	durable	foods and beverages	tobacco products	rubber	leather	textile	knitting mills	clothing	wood

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended for cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.**

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1]Includes crude il, condensate and pentanes plus. [2]Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. [3]Gross ew production by field less field flared and waste. [4]By gas utilities, **does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), as Utilities (55-002), Statistics Canada.**

Table 5: statistics of refined petroleum products[1] (thousand barrels)

year and month		total refinery receipts[2]	production of saleable products[3]								net sales in Canada[4]				
			total, all products	motor gasoline	heavy fuel oil	diesel fuel oil	light fuel oil[6]	aviation fuel[7]	asphalt	liquefied petroleum gases[8]	other products	total all products	motor gasoline	heavy fuel oil	diesel fuel oil

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]The data are collected for 1,400 municipalities and individual figures are available on request. [2]Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William-Port Arthur to form Thunder Bay. **Source: Building Permits (64-001), Statistics Canada.**

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: New Residential Construction (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property. **Source: Canadian Housing Statistics, Central Mortgage and Housing Corporation.**

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when th r current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to revision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories. Source: Retail Trade (63-005), Statistics Canada.

Note: Components may not add to totals due to rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortgages home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans and bills owing to doctors, dentists, lawyers, and other personal service credit as they are not available. [2]Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. [3]Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. Starting with January 1970 this series affected by transfer of passenger cars financed for commercial purposes from consumer goods to commercial goods; from January 1971 amounts shown exclude unearned finance charges: for December 1970 this change had the effect of reducing the gross figure by 13.5 per cent. [4]Personal cash loans of up to $1,500. made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [5]Personal cash loans of over $1,500. usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 6.5 per cent. [6]The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. Till December 1970 data for only Oil Companies. From first quarter 1971 figures include statistics for transportation and travel and entertainment card-issuing companies. For seasonal adjustment purposes seasonal factors for oil company credit cards were used to adjust the new series other credit card issuers on the assumption that the two series are subject to the same seasonal effects. [8]Bills due for residential/domestic use of telephones, gas and electric power. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, and Dept. of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

[1]Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973 only 6 major railways (accounting for 95% or more of the total operating revenues) are shown. **Sources: Railway Operating Statistics (52-003), Statistics Canada.**

[1]Prior to 1970, figures included the operations of scheduled Canadian air carriers. Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. Note that Nordair is excluded prior to 1970. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Excluding Canadian day-to-day loans. [7]Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8]Loans to grain dealers and exporters. [9]Loans to finance purchase of Canada Savings Bonds at time of issue. [10]Including loans to instalment finance companies. [11]These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

Note: Components may not add to totals due to partial revisions.
[1]End of period. [2]Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3]Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4]Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. [5]Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6]Allowance for the take-over of Nova Scotia Light & Power common shares. **Source: Bank of Canada Review.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1]The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. [2]In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. **Source: Commercial Failures (61-002) Quarterly, Statistics Canada.**

Table 11: federal government budgetary revenues[1] (million dollars)

fiscal year or month	personal income tax: deductions at source	personal income tax: other collections	corporation income tax	taxes on interest and dividends going abroad	social development tax	excise taxes: sales tax	excise taxes: other excise taxes[2]	excise duties	custom import duties	estate tax	postal revenue	return on investments	miscellaneous non-tax revenues	total budgetary revenues	budgetary surplus or deficit[3]

[1]This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie arm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-eld funds, and taxes collected on behalf of and transferred to other governments. [2]Beginning in December 1973, this category includes oil export tax. [3]March ıcludes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**
Not available pending closing of 1973-74 accounts.

Source: *Financial Flow Accounts* (13-002), Statistics Canada. For more details see (13-530), Statistics Canada.

Personal income rose by 3.7 per cent in the second quarter, following a rise of 5.4 per cent in the first quarter. However, because of very high tax refunds partly reflecting the extension of tax credit systems in a number of provinces, personal disposable income rose by 4.9 per cent, compared with 5.2 per cent in the first quarter. This led to an irregularly high personal savings rate of 9.5 per cent.

The Government Sector

Seasonally adjusted at annual rates, total expenditures of all levels of government combined, excluding intergovernment transfers, rose by 2.8 per cent in the second quarter after an irregularly high first quarter increase of 7.2 per cent. The major portion of the increase took place in spending on current and capital

TABLE 2. Gross National Expenditure, by Quarters, 1973 and 1974

Seasonally adjusted at annual rates

	1973					1974

Detail of farm inventories and GICC:										
Value of grain crop production Depletions of farm stocks of grain	− 204	− 140	− 400	208	− 134	− 184	− 300			
Change in other farm-held inventories	176	440	860	124	400	− 196	168			
Grain in commercial channels	− 220	− 476	544	− 368	− 130	− 148	392			

[1] Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts, Second Quarter, 1974,* Catalogue 13-001.

[2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

[3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

[4] The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

[5] In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

goods and services which rose by 4.7 per cent. The increase was distributed about equally among the federal, provincial and local governments. Interest payments on the public debt rose strongly, with the gain concentrated at the federal level. Transfer payments to persons rose more moderately than in the first quarter, which was affected by changes in the family and youth allowances program. Offsetting these increases somewhat was a sharp decline in subsidy payments, particularly federal subsidies, from the irregularly high rate of the first quarter when large payments were made under the National Transportation Act and a subsidy to aid consumers in Eastern Canada was introduced.

Total revenues of all levels of government combined rose by 1.3 per cent, much less sharply than in the previous quarter. The largest increase took place in revenues from corporation direct taxes and investment income. Revenues from personal direct taxes declined in the quarter, largely due to a much higher rate of refunds. The other revenue components showed little change.

As a result of revenues rising more slowly than the expenditures, the surplus of the government sector, on a National Accounts basis and including the Canada and Quabec Pension Plans, declined from $2,228 million in the first quarter to $1,512 million in the second quarter.

TABLE 3. Gross National Expenditure in Constant (1961) Dollars, by Quarters, 1973 and 1974[1]

Seasonally adjusted at annual rates

Residual error of estimate	348	- 100	56	480	196	300	400			
Gross National Expenditure in constant (1961) dollars	**75,376**	**75,656**	**76,180**	**78,168**	**76,345**	**79,304**	**79,304**			

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

03F *Revue Statistique du Canada*, mensuel.
This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

04 *Weekly Supplement to the Canadian Statistical Review*—Free to *Canadian Statistical Review* subscribers.

Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).

06 *Annual Supplement to the Canadian Statistical Review*—Price $1.40 (Free to *Canadian Statistical Review* subscribers.)

Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).

05 *Canadian Statistical Review—Historical Summary 1970*, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers)

This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

CANSIM Manuals and other Publications (Cont'd)

*12–530 *CANSIM: Operational Manual for Data Entry* (Occasional)—Price $1.40

This manual will be of practical interest only to federal government agencies which store and maintain time series in the CANSIM data base. Users desiring a fuller knowledge of the codes used and the storage methodology will find this volume a useful companion to the Retrieval manual. (Available in French, catalogue no. 12-530F.)

*12–531 *CANSIM: Users Manual for Data Retrieval and Manipulation* (Occasional) 1973 edition—Price $2.10

Gives detailed instructions on procedures for obtaining data from the CANSIM data base. The new edition reflects enlargement and improvement of the retrieval package. (Available in French, catalogue no. 12-531F.)

— CANSIM: *Summary Reference Index* (Annual, with periodic amendments) 1973 edition—Free on request.
This index summarizes data available from CANSIM and provides matrix identifiers.
Order by title from General Time Series Staff.

— CANSIM: *Series Directory* (Annual, with periodic amendments) 1973 edition—Price $15.00, or $20.00 with amendment service.

The CANSIM *Series Directory* contains matrix and series titles and descriptive detail for series available from CANSIM. It is used in conjunction with the *Summary Reference Index* and CANSIM *Manual for Data Retrieval and Manipulation* (12-531) to order series from Stastitics Canada.
Order by title from General Time Series Staff.

This Review, the above and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General of Canada. For further information direct inquiries to:

General Time Series Staff,
Statistics Canada,
Ottawa, K1A 0T6.

Amendments to catalogue numbers 12-530 and 12-531 will be issued periodically and will be available from the Publications Distribution, Statistics Canada.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, nº du catalogue 11-003F.

Series published in this Review are available on print-outs or from CANSIM, the computerized time series data bank of Statistics Canada, in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The data in the base may therefore be more timely than data on the CSR tape. For additional information see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variance.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * * * *

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

..	figures not available
...	figures not appropriate or not applicable
--	amount too small to be expressed
-	nil or zero.
†	advance estimates.
p	preliminary figures.
r	revised figures.
x	confidential to meet secrecy requirements of the Statistics Act.
MCD	months for cyclical dominance (see above).

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 5, Table 3 – Other price indexes

The price indexes of residential building materials (1961=100) have been replaced by new monthly price indexes (1971=100) for inputs of labour and materials for single detached residential construction. At present, only three summary indexes are shown in Table 3; however, Prices Division also produces residential building construction input indexes by main trades and by geographic regions. These indexes are on CANSIM and published in *Construction Price Statistics Monthly Bulletin*, Catalogue 62-007.

For more information on historical continuity with the previous index, see *Construction Price Statistics, Service Bulletin*, Catalogue 62-006, Volume 1, No. 7, February 1973.

Section 6, Table 10 – Raw hides, skins and finished leather

The series "Receipts of sheep and lamb skins" (D 2146) has been deleted with this issue. The series, however, will continue to be available in CANSIM.

Section 6, Table 18 – Radio and television receiving sets

Two series "Home set radio receivers" (D 2406) and "Auto radio receivers" (D 2408) have been deleted with this issue at the request of the source but will continue to be available from CANSIM.

Section 10, Table 6 – Consumer credit balances outstanding

The new category "trust and mortgage companies" (D 652362 and D 652363) has been added to Table 6. The series include only personal loans made by these institutions. The data for trust and mortgage companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality.

The series, "subtotal quarterly reporters" (D 3455 and D 3453) have been deleted from Table 6 in the *Canadian Statistical Review*, but up-to-date information for this category will still be available from CANSIM.

Section 13, Table 10 – Commercial failures and liabilities

This table has been deleted with this issue at the request of the source. These series will continue to be available from CANSIM.

PERSPECTIVE CANADA

H. J. Adler*

Statistics Canada has just published *Perspective Canada*, a compendium of some of the major social statistical time series available in Canada. These series are not social indicators as such because there is as yet no consensus on how to define social indicators. It may very well turn out that, at least for the time being, social indicators are simply those statistics which, by constant use in analysis and reference, are perceived as barometers of social change.

As the 1960's drew to a close, commitment to the single-minded pursuit of economic growth began to lessen in western societies. Policy makers and social scientists, as well as the media, commented increasingly on the "quality of life". The gist of this commentary was that there are several dimensions of individual and social well-being that need more attention by decision makers and statisticians. As we move through the 1970's, the demands are growing for a broad conception of the non-economic aspects of our life. Statistics Canada is moving on several fronts to make its statistical system increasingly responsive to these new demands. One facet of this activity resulted in *Perspective Canada*.

Acknowledging that this publication is partly a response to growing public concern about the quality of life in Canada, it is appropriate to inquire as to its "message". This question is raised to make clear that statistics cannot, in principle, provide direct answers. In the first instance, a direct answer should be based on an assessment of the network of criteria for quality-of-life measurements that would be valid for most Canadians. In addition, one would need to know the relative importance of these criteria. Canada has yet to have a representative national inventory on this matter. Until one is conducted and shown to be reasonably accurate, it is best to leave Canadians to judge for themselves. *Perspective Canada* is issued in the belief that whatever an individual's criteria for assessing the quality of life, and however that quality is judged, it will be concerned with some questions for which the information in this compendium is relevant.

It is a statistical portrait of the Canadian people, their activities, and their environments. Like all portraits, it reflects selectivity by the artist in the choice of themes and in the views from which various features are to be shown. Also, as the artist is limited to the tools available, so this portrait must be limited by the statistics currently at our disposal.

The presentation of a portrait often implies that there is some sense in which the artist sees the object of the portrait as a whole – something more than a mere collection of parts. The artist sees some interrelations among the parts, an organization or structure composed of the parts, which are integral to his image of the whole. Canadian society is the whole about which this portrait is concerned. In spite of the diversity of its peoples and its geography, Canada is organized by a common political system, a substantial degree of integration of regional economies, a fairly uniform system of laws, and even large elements of commonality in cultural heritage. The integrative forces of national institutions, transport networks, and markets are the clearly visible aspects, even though they are accompanied by major cultural variations associated with the diverse origins of the Canadian peoples. Furthermore, although the related political tensions may seem at various times to prove a strain to Canada as a whole, they have also spurred constant creativity in the political institutions that seek to strengthen the bonds among Canadian regions and take account of minority interests.

The information in *Perspective Canada* should help the reader to make his own assessments of how Canada has been managing to deal with important social problems. To facilitate this appraisal, the following themes in relation to Canadian social concerns have been emphasized: population and family, health, schooling, the use of time, work, income, consumption, quality of the environment, housing, bilingualism, the native peoples, cultural diversity, and criminal justice.

The original aim of the authors was to concentrate the data on the "results" of the various social processes in question. In most cases, this turned out to be impossible, not only because much of the material does not lend itself to this treatment, but mainly because there is a general paucity of operational concepts to measure "results". Many of the statistics, particularly those referring to health, education and justice, deal with inputs, costs, or means.

In numerous instances, of course, many more detailed data exist than were used. The authors have tried to illustrate the concerns with broad and summary information.

For the reader who wishes to pursue particular subjects in greater depth, and to the extent existing data permit, the statistical sources for each chapter have been listed and there are also short reading lists of mainly Canadian material. It should be stressed that the reading lists do not aim for rigorous academic completeness, but merely list writings that the reader can use as a first step toward increasing his knowledge of each subject.

The areas of concern which have been selected for inclusion are those that focus on the individual, are social rather than economic in content, and can be at least minimally quantified. Excluded, therefore, are such problems as national identity, constitutional issues, alienation, inflation, or foreign control of industry. The truly fundamental problems of personal being, such as the spiritual life, love, and friendship, are obviously outside the domain of numerical calculation.

* Mr. Adler is the Senior Advisor on Integration for Statistics Canada.

In life, concerns cannot be compartmentalized. They are interconnected and interrelated. Thus a healthy individual, other things being equal, will gain more from the educational process than a sick person. Members of one disadvantaged group such as low-income recipients frequently also find themselves among the less fortunate from the point of view of housing, justice, and the environment. Access to the benefits of publicly-supported museums and theatres is obviously circumscribed by geographical limits. In emphasizing the distributional aspects, by region, income, education or other variables, the report shows some of the interrelationships of the various concerns. These instances, however, are illustrative only, for it is impossible to deal with them exhaustively.

Highlights

The chapters on population growth and family formation provide the essential framework of information within which the broad social concerns are described.

Without health, work cannot be carried out effectively or meaningfully, leisure time cannot be enjoyed, education is difficult to acquire and, for some disabilities, even the highest level of income is insufficient recompense. Thus, if there is one fundamental concern, it is health – mental and physical. Statistically, however, health is measured mainly by its absence, and the data therefore deal with the prevalence of illness, the availability and accessibility of protective services, the external factors influencing health, and some of the costs of maintaining it.

Education, almost to the same degree as health, is a prerequisite for modern life. Personal enjoyment and fulfillment are generally assumed to be improved by education. The labour market demands a skilled work force and democracy presupposes a literate electorate. The acquisition and provision of education for personal development and economic, political and cultural participation are thus both personal and societal concerns.

The allocation of time between rest and work, effort and relaxation, is an ancient concern – one which has found formal expression in both temporal and spiritual injunctions. Industrialization and specialization both of the work and recreational aspects of man's time have only heightened this concern. Associations, governments, businesses and religious institutions all endeavour to influence, allocate and legislate our use of time. The data pertaining to leisure and rest are not too plentiful, but that portion of time spent in paid work can be amply illustrated by statistics. The concern with work is, of course, broader than merely how long we perform it. The worthwhileness of work, both from a monetary and social point of view, touches most of us deeply. Although, as usual, economic data pertaining to hours of work, pay, availability of employment and characteristics of the labour force predominate, statistics on the social aspects in terms of labour relations are not entirely lacking. Quantification of work satisfaction, on the other hand, is scarce because a good deal of both conceptual and statistical work remains to be done.

For many people, a satisfactory income, and its concomitant command over goods and services, is probably next to health in order of importance. Changes in levels of income, however, are often dependent on health, the education attainments and skills of the working population, and the opportunities for gainful employment. Therefore, it is only after having dealt with these other aspects of the human condition that we focus on the level of income, its distribution between income classes of the population, its regional disparities, its basic sources as well as its final disposition on consumer goods and services, taxes and savings.

Although the problems in health, education and the allocation of time have always, within certain limits, been subject to human influences and manipulations, the external environment was for a long time considered as both a given datum and limitless in its extent. We now know, however, that it is neither. It is very much subject to human violation – and hence to human control. The degrees of violation and control are still largely subjects of research. While many natural phenomena are quantifiable and have indeed been measured, much work remains to be done in this area.

The problem of the adequacy, availability and equitable distribution of shelter has been of long-run human concern, but preoccupation of governments with housing, particularly with aid to individuals for its acquisition, and with official encouragement for home ownership, are of more recent origin.

In addition to the physical external environment that influences the lifestyle of individuals, there are also social environmental factors that are part of the existing surroundings and which impinge on our daily lives. The question of language rights and their exercise as well as some other specific Canadian concerns are, we believe, currently pertinent Canadian issues. Thus chapters deal with bilingualism, native peoples and multiculturalism. The presence or absence of personal safety and free enjoyment of life and property are the concern of the chapter on criminal justice.

Perspective Canada *was prepared in the Office of the Senior Advisor on Integration with assistance from other groups in Statistics Canada, and other federal government departments. Readers may direct comments and questions on the report to H. J. Adler, Senior Advisor on Integration, Statistics Canada, R. H. Coats Tower, Tunney's Pasture, Ottawa, Ontario (613-992-4571).*

Copies of **Perspective Canada** *(Catalogue 11-507, Price $6.75) may be ordered from Publications Distributions, Statistics Canada, Ottawa, K1A 0T6, or from Information Canada, Ottawa.*

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. [1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitioners. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes net expenditure abroad. [2]Employer and employee contributions to social insurance and government pension funds. [3]This item is the transfer portion of interest on the consumer debt. [4]This item is equal to "personal income" less the total of "current transfers to government". **For source see Table 1.9**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source see Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

[1]The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

[1]In calculating time loss, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers: the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, they also will be shown in the total. [3]Includes miscellaneous manufacturing industries. [4]Includes also publishing and allied industries. [5]Includes also the storage and communication industries. **Source: Labour Gazette, Department of Labour.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3]Includes storage, electric power, gas and water utilities. [4]Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. Excludes agriculture, fishing, trapping, non commercial services, plywood households, public administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]See footnote 1 and source in Table 9. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 8. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

[1]The data in Tables 8 to 15 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explonatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]The data for the current year are subject to revision. [2]Includes gold. [3]Consists of general wholesale index less animal products and vegetable products component groups. [4]Consists of iron products and non-ferrous metals products component groups less gold. [5]These two series comprise the general wholesale index. [6]Excludes gold. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1]Indexes prior to May 1973 incorporate 1957 expenditure weights (1964 for Quebec City and Thunder Bay), those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2]The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3]Includes constant weighted food component. [4]These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C. P. I. major components from May 1973 forward. [5]Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. Source: Prices and Price Indexes (62-002), Statistics Canada.

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

Table 2: manufacturing shipments[1] by industry based on the 1970 standard industrial classification (million dollars)

annual average and month	total shipments	non-durable	durable	foods and beverages	tobacco products	rubber	leather	textile	knitting mills	clothing	wood

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended for cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the post. **Sources: Motor Vehicle Shipments (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.**

[1]Gas types are included. [2]Includes producers' shipments for export. [3]In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4]End of period. [5]Electric and other. [6]Excludes apartment type machines. Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1]Includes crude oil, condensate and pentanes plus. [2]Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. [3]Gross new production by field less field flared and waste. [4]By gas utilities, **does not include imports.** **Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.**

Table 5: statistics of refined petroleum products[1] (thousand barrels)

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]The data are collected for 1,400 municipalities and individual figures are available on request. [2]Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William-Port Arthur to form Thunder Bay. **Source: Building Permits (64-001), Statistics Canada.**

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: New Residential Construction (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property. **Source: Canadian Housing Statistics, Central Mortgage and Housing Corporation.**

[1]Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P. E. I. [2]Shipments by principal manufacturers. Tal domestic shipments are somewhat higher. [3]Production for these items. As reported by principal manufacturers. Total production is somewhat higher. ilding contractors, public and utility construction and structural steel fabricators.

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to revision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories.

Source: Retail Trade (63-005), Statistics Canada.

Note: Components may not add to totals because of rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2]Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3]Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4]Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5]Includes bank-sponsored credit card balances. [6]The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7]Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8]Bills due for non-commercial use of telephones, gas and electric power. [9]Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, and Department of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated parately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important e: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of nada, Exports (65-004), Statistics Canada.**

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the rage of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery e been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (.007), Statistics Canada.**

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

year and month	total railway revenue freight loadings (carload and non-carload) ('000 tons) unadj.	total railway revenue freight loadings (carload and non-carload) ('000 tons) S.A.	total revenue cars loaded (carload only)	farm products and food: wheat	other grain and grain products	fresh fruits and vegetables	other agriculture products	animals and their products	prepared food products	mine products: iron ore and concentrates	other metal ores and concentrates	potash	coal, sand, cement and other mine products

[1]Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

Note: Components may not add to totals due to partial revisions.
[1]End of period. [2]Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3]Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4]Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. [5]Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6]Allowance for the take-over of Nova Scotia Light & Power common shares. **Source: Bank of Canada Review.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Micro-Data Release Under the Revised Statistics Act

With the passage of the revised Statistics Act in 1971, Statistics Canada was able, for the first time, to contemplate the possibility of making micro-data available to users, **provided that the data cannot be associated with a particular respondent**. Micro-data, in this context, is defined as a set of social or economic characteristics derived from a particular survey unit, for example, individual, household, etc. Such data has come to be regarded as increasingly important in recent years for uses such as micro-simulation which relies on preserving associations between an extensive group of characteristics.

The bureau has ascertained that micro-data can be released to users without violating confidentiality provided the following requirements are met.[1]

The first, and most obvious, requirement is the complete suppression of all explicity identifying information such as name, address, etc.

A second requirement is that the data must relate to only a small sample of a much larger population and, generally, one for which no complete frame exists, at least outside the bureau.

A third requirement is that the characteristics presented, in micro-data form, for any survey unit must be limited in range. More precisely, the extent to which characteristics tend to identify survey units is a function not only of the precision with which characteristics are measured but also of the extent to which characteristics relate to broadly different aspects of the economic or social status of the survey unit.

Finally, unusual characteristics, or combinations of characteristics which are unusual, must be masked either by suppression or by grouping to broader classes.

It has proved possible to meet these requirements for certain data derived from surveys and censuses of individuals and households without a substantial distortion of such data.

For data relating to individuals and households, the most radical suppression has been the dropping of detailed area codes. Beyond this, some severe regrouping of particular characteristics has been necessary, notably those characteristics initially coded to a detailed level, such as industry of employment and occupation.

The most useful sources of micro-data relating to individuals, households and families are the monthly Labour Force Survey, the biennial full-scale Survey of Consumer Finance and the 1971 Census of Population micro-data from each of these sources are planned for release in the near future.

Labour Force Survey

At the Conference on the Labour Force Survey held in October 1973, a paper was distributed which dealt with the bureau's intentions regarding the release of micro-data derived from the Labour Force Survey including the enumerated special questions. It was indicated at that time that Statistics Canada would begin to provide micro-data from this source to users on a regular basis in the Spring of 1974. Unfortunately, a number of unanticipated delays have been encountered but data from this source will be available shortly. Enquiries about the specific months for which data are available, the contents of data sets and costs should be addressed to:

Mr. B. Petrie,
Labour Force Survey Division,
Statistics Canada,
Tunneys Pasture,
Ottawa, Ontario.
K1A 0T6

Consumer Finance

Data from the 1972 Survey of Consumer Finance are now available. Because of the complexity of these data, the Consumer Income and Expenditure Division, responsible for providing user support, may have to limit distribution of these data, at least in the short term. Enquiries should be directed to:

Miss A. Stead,
Consumer Income and Expenditure Division,
Statistics Canada,
Tunney's Pasture,
Ottawa, Ontario.
K1A 0T6

Census

The bureau plans to produce a number of micro-data sets from the 1971 Census of Population based on a sample of approximately one per cent of returns. It is anticipated that three such samples will be prepared relating to individuals, households and families respectively. If an evaluation proves that useful data can be provided without any danger of a breach of confidentiality, micro-data from the 1971 Census may be made available during the period late 1974 to early 1976. The sample pertaining to individuals would be the

[1] These requirements for providing micro-data differ somewhat from those used by U.S. agencies, including the Bureau of the Census. A study dealing with legal and policy aspects of informational privacy and access to micro-data sponsored by the Ford Foundation is now being carried out by Messrs. Hanis and Flaherty of the University of Western Ontario. The study will include a comparison of the practices with respect to micro-data release for a number of developed countries including Canada. Statistics Canada may wish to review its longer term policy in respect of micro-data preparation and release when the results of this study are available.

first to be released. Further information on developments of Census micro-data will appear in later editions of the *Canadian Statistical Review.*

Would-be users are advised that, in all cases, terms of sale will be by contract with individual users and will limit both secondary distribution of data and access to support services. Further constraints will apply in respect of attribution and publication. Costs will be related to complexity and size of market and will vary from approximately $100 to more than $1,000.

Co-ordinating Centre for Statistics on Computer/Communications

Dr. Sylvia Ostry, Chief Statistician of Canada, announced on July 9, 1974 the creation of a Statistical Co-ordinating Centre within Statistics Canada for statistics on computer/communications. At the same time, she appointed Mr. F.W. Emmerson, Co-ordinator, Financial Statistics, to assume responsibility for the Centre. He will be assisted by Miss Stella Gianetto of his staff.

The objective of the Centre is to improve the availability and use of data on computer/communications. (Computer/communications is a term used to describe the areas in which computers are used in combination with communication networks.) To achieve this objective, the Statistical Co-ordinating Centre proposes to:

- Assemble information on computer/communications now collected by Statistics Canada and by others.
- Serve as a central point from which potential users of information on computer/communications can receive assistance and advice on the information available.
- Work with the Secretariat of the Federal Interdepartmental Committee on Computer/Communications on the determination of user needs, on the priorities to be attached to them, and on how best to satisfy them.
- Work with other federal government departments, with provincial governments and with business, to draw on their knowledge in this field and to keep them informed of developments.

No new surveys are planned by Statistics Canada in the field of computer/communications, but it is expected that more effective use will be made of the information gathered in existing surveys.

Considerable effort will be put into the development of lists and classifications. This will make it possible to bring together information from various sources and put it together in a consistent fashion.

More information on this topic can be obtained from Mr. F.W. Emmerson and Miss Stella Gianetto, Station A, 25th Floor, R.H. Coats Bldg., Statistics Canada, Ottawa, Ontario, K1A 0T6 (Telephone: 613-992-5984).

Monthly Radio Time Sales Survey

Radio time sales statistics are now available for the first three months of 1974. The Communications Section of Statistics Canada started a monthly survey of all commercial radio time sales (including those of the CBC) in January 1974, and the first results were published in *Communications* (Catalogue 56-001) Vol. 4, No. 14, August 1974.

Gross and net sales for A.M. and F.M. radio stations are presented in the bulletin. The statistics are also classified into national and local sales.

Information on this new survey is available from Patrick Crosby, Communications Section, Transportation and Communications Division, Statistics Canada, Ottawa, K1A 0V5 (Telephone 613-996-9274).

Multinational Corporations

In May 1974, a report entitled *The Impact of Multinational Corporations on the Development Process and on International Relations* was released by the United Nations Economic and Social Council. The report was prepared by a "Group of Eminent Persons" appointed by the United Nations Secretary-General. Its contents rest to a considerable degree on hearings of testimony from leading personalities of diverse interests, and on various background papers prepared under the auspices of the United Nations.

The report, which is in three parts, deals first with a general survey of the issues at stake, including the general role and characteristics of Multinational Corporations; secondly, with specific issues and potential problems related to the activities of MNCs; and thirdly, with the supplementary views of individual members of the Group. The first two parts of the report contain many far-reaching recommendations addressed both to home and host countries regarding the treatment of MNCs and the relationship of MNCs and governments.

Of special interest from a statistical and informational viewpoint are the suggestions in the report that, (i) an information and research centre on MNCs should be established for the gathering, analysis and dissemination of information to all interested parties, and (ii) an expert group be convened on international accounting standards to identify information needs, determine how and in what form information should be collected and decide how best it could be used.

A separate chapter on "Information Disclosure and Evaluation", in addition to the above suggestions, recommends the disclosure of principal terms of agreements between governments and MNCs to the proposed information and research centre, and suggests that,

through the machinery for formulating and implementing government policies toward MNCs, procedures be devised for collection of information about their performance.

The report and its recommendations are presently being analysed and considered by UN member countries.

The Impact of Multinational Corporations on the Development Process and on International Relations, *United Nations, New York, 1974. Catalogue 74.II.A.5. Price: $10. Canadian purchasers may order this report from Information Canada, Ottawa. It is available to other subscribers from their authorized United Nations bookstores.*

New Construction Prices Reports

The publication *Construction Price Statistics Service Bulletin* (Catalogue 62-006) is being discontinued this month. It is being replaced by two new publications, (*Construction Price Statistics Monthly Bulletin* (Catalogue 62-007) the first issue of which will be published at the end of October, and *Construction Price Statistics Quarterly Report* (Catalogue 62-008) to be first issued at the end of November.

Both publications will contain the statistics that have up to now been released in the service bulletin, and both will be sent to subscribers for the balance of their subscription to publication, Catalogue 62-006.

The new publications will assist in the use of construction price statistics. Timely release is provided in the monthly publication wherein all construction price statistics are released in summary form. No detail is provided in this publication except for the monthly input indexes of building construction. Full detail can be obtained from the quarterly publication.

Feature articles will be released from time to time, the same article appearing in both the monthly and quarterly publications.

More information about these publications may be obtained from L.J. Seary, Capital Expenditures Prices Section, Prices Division. Statistics Canada, Tunney's Pasture, Ottawa, Ontario, K1A 0T6 (Telephone 613-996-2565).

3F	*Revue Statistique du Canada*, mensuel. This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

4	*Weekly Supplement to the Canadian Statistical Review*—Free to *Canadian Statistical Review* subscribers.

Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).

6	*Annual Supplement to the Canadian Statistical Review*—Price $1.40 (Free to *Canadian Statistical Review* subscribers.)

Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).

5	*Canadian Statistical Review—Historical Summary 1970*, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers)

This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

CANSIM Manuals and other Publications*

CANSIM: An Introduction to the Canadian Socio-economic Information Management System—Free on request.

CANSIM Manuals and other Publications (Cont'd)

*12-530	*CANSIM: Operational Manual for Data Entry* (Occasional)—Price $1.40

This manual will be of practical interest only to federal government agencies which store and maintain time series in the CANSIM data base. Users desiring a fuller knowledge of the codes used and the storage methodology will find this volume a useful companion to the Retrieval manual. (Available in French, catalogue no. 12-530F.)

*12-531	*CANSIM: Users Manual for Data Retrieval and Manipulation* (Occasional) 1973 edition—Price $2.10

Gives detailed instructions on procedures for obtaining data from the CANSIM data base. The new edition reflects enlargement and improvement of the retrieval package. (Available in French, catalogue no. 12-531F.)

—	CANSIM: *Summary Reference Index* (Annual, with periodic amendments) 1973 edition—Free on request.

This index summarizes data available from CANSIM and provides matrix identifiers.
Order by title from General Time Series Staff.

—	CANSIM: *Series Directory* (Annual, with periodic amendments) 1973 edition—Price $15.00, or $20.00 with amendment service.

The CANSIM *Series Directory* contains matrix and series titles and descriptive detail for series available from CANSIM. It is used in conjunction with the *Summary Reference Index* and CANSIM *Manual for Data Retrieval and Manipulation* (12-531) to order series from Stastitics Canada.
Order by title from General Time Series Staff.

This Review, the above and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General of Canada. For further information direct inquiries to:

A Guide to the National Income and Expenditure Accounts

Statistics Canada Statistique Canada

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada nº du catalogue 11-003F.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The date in the base may therefore be more timely than data on the CSR tape. For additional information, see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 1 – Selected Economic Indicators p. 17

Data on consumer credit balances outstanding for the category "total monthly reporters" are not annual accumulations or averages but are end-of-period figures. For example, the figure for 1973 is the amount of consumer credit outstanding at the end of December 1973. Therefore, in order to give a better indication of the year-to-year changes, the unadjusted end-of-period data have been replaced with seasonally adjusted end-of-period figures. The quarter-to-quarter and month-to-month percentage changes have been, and will continue to be, computed from seasonally adjusted data.

Section 4, Table 7 – Help Wanted Index

The tables in Section 4 have been renumbered to accomodate an addition to the Section. The new Table 7 presents quarterly indexes measuring help wanted advertising. These indexes are used as indicators of the numbers of jobs available in various regions. Background information on these measures is available in the OBSERVATIONS Section of the April 1974 *Canadian Statistical Review*, or from Statistics Canada's Labour Division.

The Canadian Statistical Review Annual Supplement will be delayed this year because of problems arising from automating the publication. Normally, the *Annual Supplement* is released in the fall of the year. When automation is completed, the time lag between availability of data and publication will be reduced, and the *Annual Supplement* can be released in mid-summer.

This paper is adapted from a forthcoming report of Statistics Canada's Gross National Product Division. The report, *A Guide to the National Income and Expenditure Accounts,* is designed as a basic reference compendium which describes and explains this key set of economic statistics. The following paper focuses on the historical setting for the accounts and outlines some of their uses and applications.

The Historical Setting

The National Income and Expenditure Accounts are now used for economic decision-making and policy analysis in a variety of fields. They constitute a central framework of statistics essential for appraising and evaluating the course and pattern of economic developments. As essential as these statistics are in to-day's economic analysis, Canada's national accounting system is less than 30 years old.

The development of National Income and Expenditure Accounts for Canada was powerfully influenced by the experience of the Great Depression and World War II. In particular, the Depression of the 1930's shattered traditional economic thought and challenged economists and statisticians to improve their theoretical framework and strengthen and systematize the collection of quantitative data. In 1933, no one in a policy-making position in Canada knew how far production and income had fallen from the peak in 1929, or even how many people were unemployed. No theory had evolved to explain a depression on this scale, and no figures were available to describe its full dimensions. The statistical system had not developed at this stage to a point where such critically important information on the state of the economy was available. The problems associated with mobilization and the operation of a controlled wartime economy in the 1940's focussed further attention on the need for a much broader range of statistical tools to assist the government in managing the economic affairs of the nation. Efforts were made during the war within the departments of the federal government to produce rough National Income and Expenditure estimates for purposes of planning and post-war reconstruction.[1] In addition, discussions were held in Washington in the fall of 1944 with United States and United Kingdom experts on the questions of developing an appropriate theoretical framework for National Income statistics, but essentially, a concentrated effort to develop National Income and Expenditure Accounts for Canada had to wait until after the end of hostilities.

Basically, the work on the development of a system of National Income and Expenditure Accounts for Canada had its origins in the 1945 White Paper on Employment and Income published just one month before the end of the war in Europe.[2] In this paper, the government set out, in broad terms, the policies which it intended to follow during the period of reconstruction. The major theme of this paper was that the adoption of high and stable levels of employment and income, and higher standards of living, would be a primary aim of government policy in the post-war period. The depression which preceded the war had demonstrated that industrialized economies were not self-regulating mechanisms which would necessarily or automatically adjust to a level of full employment. The experience of the depression had forced theoreticians and policy-makers to re-examine their positions and to probe more deeply for an understanding of economic processes. In this connection, the work of John Maynard Keynes was to become a seminal influence. The problems associated with running a war-time controlled economy under conditions of full mobilization had further emphasized the need for extending the range of economic information, and in a way which would describe the behavior of the economic system in its larger dimensions. The transition to peace and post-war reconstruction which began in 1945 presented new and difficult problems of adjustment in which the government would necessarily be required to play a major role. Against this background, the 1945 White Paper placed on record the key objectives which the government intended to pursue in carrying forward its reconstruction program in the post-war years.

In line with these objectives, the government acted to establish a more comprehensive and fully integrated system of economic reporting. The initial task was to improve and extend the statistical tools available for charting the course of economic developments, and to establish a framework for measuring the level and outcome of the nation's economic performance. In 1945, a Central Research and Development Staff was established at the (then) Dominion Bureau of Statistics, charged with the tasks of coordinating the Bureau's work in the field of economic statistics and of developing a set of National Income and Expenditure Accounts for Canada. A quarterly labour force survey was begun at about the same time, and steps were taken to establish a survey of the capital investment intentions of businesses and governments. Concurrently, the Economic Research Branch of the (then) Reconstruction Depart-

[1] W.A. Mackintosh, "The White Paper on Employment and Income in Its 1945 Setting", published in *Canadian Economic Policy Since the War* (six public lectures in commemoration of the twentieth anniversary of the 1945 White Paper), Canadian Trade Committee, Private Planning Association, 1966.

[2] *Employment and Income, With Special Reference to the Initial Period of Reconstruction,* King's Printer, Ottawa, April 1945. This and the following paragraph draw heavily on a government paper prepared in 1965 for the Organization for Economic Cooperation and Development, "Canada: Short-Term Forecasting in the Federal Service," published in *Techniques of Economic Forecasting.* OECD, Paris, 1965.

ment was assigned responsibility for preparing, on a regular basis, short-term forecasts of the level of economic activity.

The Canadian system of National Income and Expenditure Accounts which emerged from these initiatives was developed at the same time as similar efforts in other countries. Indeed, the basic theoretical framework – which is much as it stands today – was put together during the course of discussions among representatives of the United States, the United Kingdom and Canada in the fall of 1944, at which time a large measure of clarification and agreement was reached. In the years since the war, material published in the Reports of the Conference on Research in Income and Wealth (sponsored by the National Bureau of Economic Research), the International Association for Research in Income and Wealth, official government reports, professional journals, and numerous text-books have gone far toward building up a comprehensive body of literature in the field. The work of the United Nations has also done much to disseminate and systematize the results of these studies. The Canadian National Accounts have benefited from all these developments.

During the last half of the 1940's, regular estimates of Gross National Product and Expenditure were prepared and published in Canada on an annual basis. In this period, the essentials of the statistical framework were established and tested out in an operational way. The first basic reference document, containing annual estimates for the period 1926-50, was published in early 1952. In the fall of 1953, the first report on quarterly estimates of Gross National Product and Expenditure was published, covering the period 1947-52. Since that time, quarterly estimates of the National Income and Expenditure Accounts have been prepared regularly each quarter.

The evolution of a statistical system tends to reflect and respond to the changes taking place in the society. Against the background of depression and war, Canadians made explicit new economic goals embodied in the 1945 White Paper. But during the post-war period, the number of economic goals which Canadians have set for themselves, to be achieved simultaneously and consistently, has multiplied. These goals now include full employment, a high rate of economic growth, reasonable price stability, a viable balance of payments position, and an equitable distribution of income. As the goals have become more ambitious, more explicit, and more difficult to attain consistently, the demand for economic information to guide decision-making has grown steadily – information covering new areas, more timely information, and higher quality information. The National Income and Expenditure Accounts have continued to be shaped and influenced by these demands, as have other sets of economic statistics published by Statistics Canada.

It is possible, by generalizing very broadly, to discern three fairly distinct phases in the evolution of post-war economic developments. In each phase, the growing list of economic objectives had tended to be characterized by special concerns which have influenced the demand for and the nature of our economic statistics. These three stages can perhaps be summarized in a general way: a period covering the late 1940's and the decade of the 1950's in which the principal concern was with the problems of "stabilization" – the avoidance of recession; a period covering the decade of the 1960's in which the goal of "economic growth" came to occupy a more dominant role, and during which time the North American economy underwent the longest expansion in its history; and, more recently, the emergence of strong concerns about the quality of life and the side-effects of economic growth, with a shift in emphasis toward problems of welfare, resource use, social choice, and the question "growth for what? ".

In the immediate post-war period, the principal concern of economic policy was "stabilization" – to avoid the possibility of a down-turn in the economy accumulating into a major depression such as occurred in the 1930's. Policy was heavily focussed on minimizing fluctuations in the business cycle and only indirectly on the problem of realizing the economy's large and continually expanding potential. Governments tended to think of their role as a "balance wheel" in the economy, adding to total demand whenever private demand weakened, and constraining total demand whenever the latter became excessive. The business cycle provided the basic analytical framework for appraising and evaluating current developments in the economy. During this period, emphasis was given in the statistical programs of Statistics Canada to the development of data for measuring cyclical fluctuations in the economy. The quarterly National Income and Expenditure Accounts were developed and published in the early 1950's, and rapidly achieved prominence as a key set of data for appraising current business cycle developments. The increasing size and importance of government revenues and expenditures, and their influence on the level and direction of economic activity, led to a rapid expansion of the detail underlying the government sector of the Accounts. Large efforts were made to expand the seasonal adjustment program at the Bureau – not only the seasonal adjustment of the National Income and Expenditure Accounts but also of a wide range of closely related business cycle indicators. By the mid-1950's, seasonal adjustment of time series by electronic computers had become feasible, and this greatly facilitated the task of providing a large amount of statistical information on a seasonally adjusted basis to permit

ready identification of underlying cyclical movements.[3] At the same time, the Economics Branch of the Department of Trade and Commerce did much valuable work in the "dating" of Canadian business cycles, identifying the timing of peaks and troughs, studying the behavior of leading, lagging and coincident indicators, and undertaking studies of the average length of cyclical recessions and expansion in Canada.[4]

The emphasis in the White Paper had been "to maintain a high and stable level of employment and income". The wording implied that there would be a strong focus on "prevention". The installation of new economic and social machinery in the 1940's and the 1950's was very much influenced by the desire to create "built-in stabilizers" for employment and income maintenance. But as John Deustch has pointed out:

> "There was no similar emphasis (in the White Paper) on the maintenance of a reasonably stable price level; there was no explicit reference to a rapid rate of economic growth; there was surprisingly little concern about the balance of payments. However, the events of postwar history brought these matters to the fore one after another. The experience of inflationary pressure demonstrated quite sharply that there was a problem about prices and the cost of living. The cold war, strong East-West competition for power and influence, rapid technological progress and the new dynamism of the older industrial countries, all contributed to an increasing preoccupation with the task of achieving a rapid rate of economic growth. The problem of maintaining external stability was never far away."[5]

In the late 1950's and early 1960's, unemployment rose sharply in Canada (and in North America generally), and this was accompanied by a slowing in the rate of economic growth, the accumulation of a large amount of economic slack and a generally unsatisfactory economic performance. Partly in response to this situation, the Economic Council of Canada was created in 1963. One of its major tasks was to recommend what government policies, in the opinion of the Council, would best help to realize the potentialities and growth of the economy. The concept of "potential" Gross National Product, and the growth of this potential, thus came to assume a major role in the Council's work. The "potential" GNP emphasized the output which could be produced if the labour force were fully employed and industrial capacity fully utilized. In an economy with an expanding labour force and an average annual increase in productivity, this potential was always growing. The view that demand management should be deliberately aimed at steering the economy along the underlying path of this continually expanding "potential" (rather than seeking simply to counter cyclical fluctuations) became one of the early themes of the Council's reports. What was emphasized was that the level of demand should be sufficient to purchase the output which a fully employed economy could produce, and that the standard for judging economic performance should be whether the economy was measuring up to its "potential" rather than whether it was simply advancing cyclically.

The shift from a preoccupation with "stabilization" toward a greater emphasis on "economic growth" and the economy's expanding potential was a development which occurred in a large number of countries in the 1960's. Much of the impetus came from the collective growth goal established by the member countries of the Organization for Economic Cooperation and Development at the beginning of the decade. These countries collectively agreed that they should aim to increase the physical volume of production of the 21-member OECD group (including Canada and the U.S.) by 50 per cent in the ten years 1960 to 1970.[6] (This goal was in fact exceeded.) This commitment, which established the goal of strong economic growth as one of the central objectives of governments in almost all of the world's advanced industrial countries, was one of the important economic developments of the decade. In the United States, the turn toward "growth" as a

[3] The seasonal adjustment of time series by electronic computer was initially developed by Julius Shiskin, Chief Economic Statistician at the United States Bureau of the Census in the mid-1950's (see his *Electronic Computers and Business Indicators*, Occasional Paper No. 57, National Bureau of Economic Research, New York, 1957). The Canadian program of seasonal adjustment owes a heavy debt to this work, and to the helpful collaboration which developed between the (then) Dominion Bureau of Statistics and the United States Bureau of the Census. Mention should also be made of the pioneering work of the National Bureau of Economic Research, whose basic studies of the business cycle have provided economists with the methodological framework for analysing business cycle developments. (See National Bureau of Economic Research, *Business Cycle Indicators*, Volumes 1 and 2, Princeton University Press, Princeton, 1961.)

[4] While a large part of this work was undertaken for internal use within the government, much of it also found its way into published reports, for example, in the *Report of the Special Committee of the Senate on Manpower and Employment* (Queen's Printer, Ottawa, 1961), the *Report of the Royal Commission on Banking and Finance* (Queen's Printer, Ottawa, 1964), the *Report of the Organization for Economic Cooperation and Development on Seasonal Adjustment on Electronic Computers* (OECD, Paris, 1961), and various professional journals.

[5] John J. Deustch "Canadian Economic Policy 1945-1965: A Summing Up", published in *Canadian Economic Policy Since the War* (six public lectures in commemoration of the twentieth anniversary of the 1945 White Paper) Canadian Trade Committee, Private Planning Association, 1966.

[6] See *Policies for Economic Growth*. Organization for Economic Cooperation and Development, Paris, 1962. Also, *The Growth of Output, 1960-1980: Retrospect, Prospect, and Problems of Policy*, OECD, Paris, 1970.

principal goal had begun even earlier, prompted by the launching of Sputnik by the U.S.S.R. in the late 1950's, and subsequently was reinforced by the generally unsatisfactory performance of the United States economy after the 1957-58 recession. The massive tax cut in the United States in the early 1960's recommended by the Council of Economic Advisers was a "growth-oriented" measure designed to close the output gap and get the U.S. economy moving back up toward its potential. The path-breaking work of the American economist Edward Denison in the 1960's on sources of economic growth had a major influence in educating decision-makers on the options available for promoting growth, in the United States as well as in other countries.[7]

The attention given to "economic growth" as an objective of policy in the 1960's was a factor influencing priorities in statistical work. It emphasized the critical importance of maintaining consistent and continuous records of income and output over considerable periods of time. It focussed attention on inadequacies in the measurement of the physical volume of output which led subsequently to steps to improve them. It pointed up the crucial role of productivity in the growth process and kept this matter in the forefront of statistical priorities. It influenced the decision to give major support to the development and production of real output by industry statistics. And finally, it led to the joint development of a "growth model" of the Canadian economy by the Economic Council of Canada and other agencies of the federal government which is now generating new and increasingly sophisticated demands on the statistical system.

At the beginning of the 1970's, there is apparently emerging a growing uneasiness and disenchantment with the process of economic growth. Economic growth is being attacked as a major source of environmental pollution and the cause of a declining quality of life. Social costs, or "negative externalities" associated with the growth process are now generating mounting concern. Economists are accused of being preoccupied with maximizing the size of the Gross National Product to the exclusion of other basic considerations including the preservation of air, land and water resources upon which all life on the planet depends. In many countries, a shift in political priorities is apparently taking place, with pollution abatement and the preservation of the environment high on the agenda. Concern with the growth of economic output as such is being replaced by concern with "the problem of social choice" – of how that output is being used, what the alternatives are, and how the choices are likely to affect people's well-being. This is reflected in a decision of the Organization for Economic Cooperation and Development that future work on growth problems will entail a shift in emphasis from the growth of aggregate output to the growth of social welfare in a wider sense, including questions relating to the allocation of the growing volume of national resources between public and private uses.

The Economic Council has pointed out that the goal of economic growth is not an end in itself, but simply a means for achieving other ends – for providing the resources with which to fulfill the vast array of wants and needs in our society. Economic growth is a "performance" goal, the attainment of which is desired in order to reach certain "achievement" goals, including those associated with a higher quality of life. How will the nation's growing productive resources be used to meet the wants and aspirations of the society? How can economic growth, which is needed to generate this growing volume of resources, be reconciled with preservation of the environment and the conservation of non-renewable materials? These are questions which are now exercising the minds of many people in Canada as well as in other countries. In the course of this wide-ranging debate, new demands for statistics are emerging, among them a demand for "social indicators" which will better measure the welfare or "quality of life" status of the people.

The National Income and Expenditure Accounts do not measure social welfare. They are centred around the measurement of market-based activity, and they follow clearly defined market-based criteria.[8] They take no account of social costs or "negative externalities" such as air and water pollution caused by the private use of public goods, or the disamenities caused by traffic congestion and urban crowding. In this specific sense, they cannot measure changes in welfare, although the general view has been that increases in welfare have, in the past, usually tended to be associated with increases in real per capita incomes. Although the Accounts cannot cope with questions of social welfare, they can shed a good deal of insight into questions of "social choice". They show, on the expenditure side, how the resources of the economy are allocated among major uses. This information is likely to become increasingly relevant in societies where attention is shifting to problems of choice and priority in resources use.[9]

Uses and Applications

It has been said that the National Income and Expenditure Accounts represent an attempt to construct

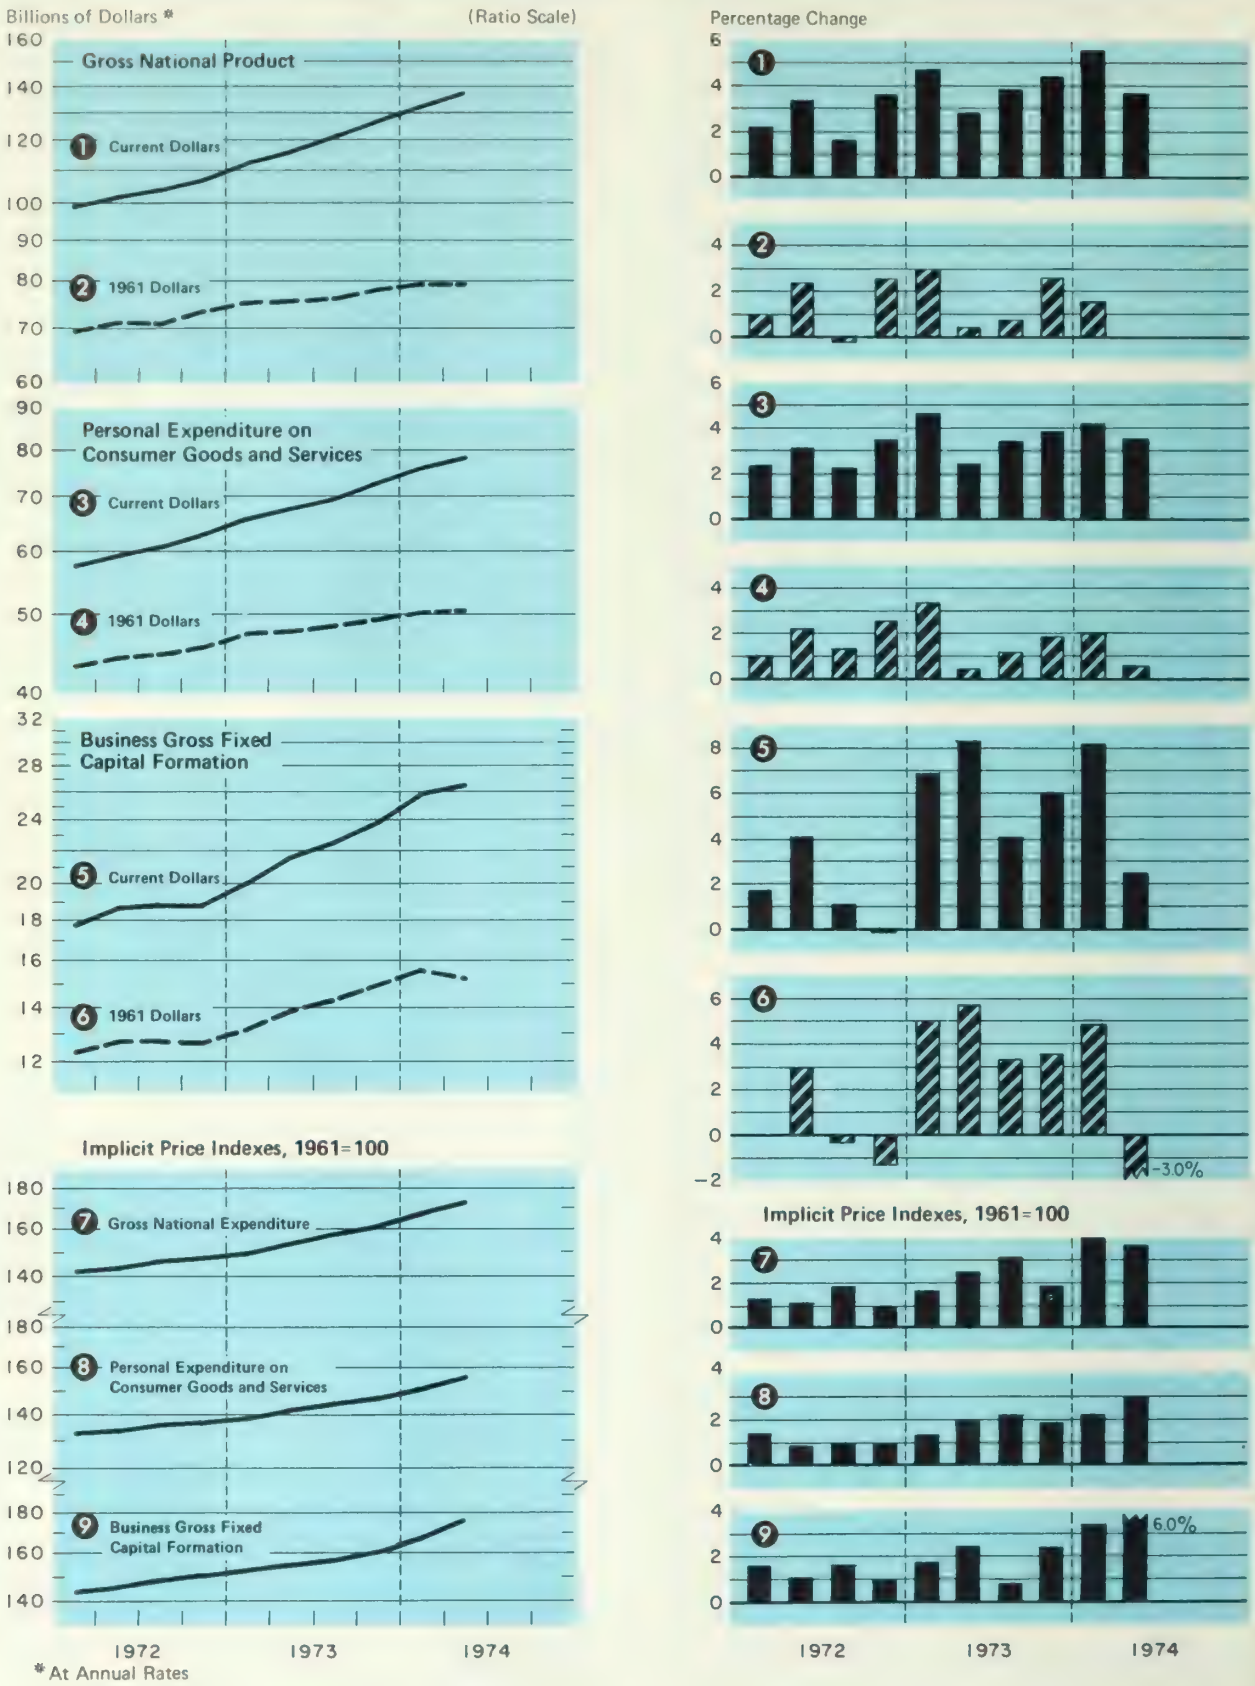

[7] Edward F. Denison, *The Sources of Economic Growth in the United States and the Alternatives Before Us,* a Supplementary Paper for the Committee for Economic Development, New York, 1962. Also, *Why Growth Rates Differ: Post-War Experience in Nine Western Countries,* the Brookings Institution, Washington, D.C., 1967.

[8] The terms "market-based activity" and "market economy" are used in this paper to refer to the money-exchange economy which includes the activities of governments and non-profit institutions as well as the activities of business enterprises operating for a profit.

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. **Source: Quarterly Bulletin, Department of Manpower and Immigration.**

[1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitioners. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

Table 1.2: gross national expenditure (millions of dollars)

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are eated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of e treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have een generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source se Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

Table 2.3: industrial production, volume indexes (1961 = 100), based on the 1960 standard industrial classification – continued

year and month		durable manufacturing															
		primary metal industries					metal fabricating (ex mach. & transportation equipment)								transp. equipment		
		total	iron & steel mills	steel pipe & tube mills	iron foundries	smelting and refining	total	boiler & plate works	fabricated structural metal	ornamental & architectural metal	metal stamping, pressing & coating	wire & wire products	hardware, tool & cutlery	machinery (except electrical)	total	aircraft and parts	motor vehicles[1]

[1]The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

[1]In calculating time loss, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as ose laid off as a result of a work stoppage, is not included. [2]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 orkers: the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are t shown separately. Should strikes occur in these industries, they also will be shown in the total. [3]Includes miscellaneous manufacturing industries. [4]Includes so publishing and allied industries. [5]Includes also the storage and communication industries. **Source: Labour Gazette, Department of Labour.**

[1]See footnote 1 and source in Table 10. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

Table 12: average weekly wages and salaries,[1] by industrial division, based on the 1960 standard industrial classification (dollars)

year and month	industrial composite	forestry	mining, including milling	manufacturing			construction	transportation, communication and other utilities	trade		finance, insurance and real estate	service
				total	non-durable goods	durable goods			wholesale	retail

[1]The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explonatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]Indexes prior to May 1973 incorporate 1957 expenditure weights (1964 for Quebec City and Thunder Bay), those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2]The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3]Includes constant weighted food component. [4]These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C.P.I. major components from May 1973 forward. [5]Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

annual average and month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month						ratio of inventories owned to shipments
				owned[3]	held but not owned	all inventory held: total	raw materials	goods in process	finished products

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended for cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments** (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1]Gas types are included. [2]Includes producers' shipments for export. [3]In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4]End of period. [5]Electric and other. [6]Excludes apartment type machines. [7]Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1]Includes crude oil, condensate and pentanes plus. [2]Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. [3]Gross new production by field less field flared and waste. [4]By gas utilities, **does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.**

Table 5: statistics of refined petroleum products[1] (thousand barrels)

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and greases, still gas and other products. Source: Refined Petroleum Products (45-004), Statistics Canada.

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: New Residential Construction (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property. Source: Canadian Housing Statistics, Central Mortgage and Housing Corporation.

[1]Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P.E.I. [2]Shipments by principal manufacturers. [3]Production for these items. As reported by principal manufacturers. Total production is somewhat higher. otal domestic shipments are somewhat higher. uilding contractors, public and utility construction and structural steel fabricators.

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as nging quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of n with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to ision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes ilding Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom k, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories. **Source: Retail Trade (63-005), Statistics Canada.**

Note: Components may not add to totals because of rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential rtgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills ng to doctors, dentists, lawyers, and other personal service credit. [2]Conditional sales agreements held by sales finance companies and by consumer loan panies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. rsonal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. rsonal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5]Includes bank-sponsored credit card balances. e data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7]Amount owed personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing com- ies. [8]Bills due for non-commercial use of telephones, gas and electric power. [9]Personal cash loans only. The data for mortgage and trust companies are not sonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer dit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated
irately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important
Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of**
ada, Exports (65-004), Statistics Canada.

Table 4: merchandise imports, by commodity, based on the standard commodity classification[1] (million dollarx)

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the erage of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery ve been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) w include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports** 5-007), **Statistics Canada.**

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

[1]Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973, only 6 r railways (accounting for 95 per cent or more of the total operating revenues) are shown. [2]The data for August 1973 do not follow the pattern for the other n ths of 1973. The decreases in most categories are a result of the railway strike in this month. **Source: Railway Operating Statistics (52-003), Statistics Canada.**

[1]Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional a nes (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total re nues and expenses reported by Canadian commercial air carriers. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air C ier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Excluding Canadian day-to-day loans. [7]Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8]Loans to grain dealers and exporters. [9]Loans to finance purchase of Canada Savings Bonds at time of issue. [10]Including loans to instalment finance companies. [11]These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

NOTE: Components may not add to totals because rounding. [1]This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2]Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing Centres (61-001), Statistics Canada.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base tals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks luded in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries cept electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. New Health Division

The former Health and Welfare Division of Statistics Canada's Institutional and Public Finance Branch has now become the Health Division. The objective of the Health Division is to provide information on three aspects of the health of Canadians: (1) the health care system (2) epidemiology – the incidence and prevalence of disease and disability, and (3) demography – the components of population change. In seeking to fulfill this objective, the Division uses a wide range of routine administrative records as well as special surveys.

In Canada, as in other developed countries, the health care system has expanded rapidly during the past quarter century so that the costs of health care consume a significant fraction (about 7 per cent) of the GNP and dominate both federal and provincial budgets. The system involves human resources, many with highly specialized training, working in hospitals and other health care facilities. These resources are utilized by patients chiefly through the hospital and medicare insurance schemes. A good deal of information on hospitals and hospital personnel is available. High on the Division's priorities is the need to improve the scope of the information on those parts of the system outside hospitals.

Information on the incidence of disease and disability is important for two reasons. First, the study of the geographic and temporal patterns of disease and its incidence within different groups (e.g., occupations) alerts research workers to the presence of environmental hazards and furnishes hypotheses on the causal factors concerned. Secondly, knowledge of the prevalence of disease and disability is important to health administrators assessing the need for and effectiveness of health care programs.

The basis of all national statistical systems is a detailed knowledge of population structure. The Health Division contributes to this knowledge those components of population change and family formation recorded through vital statistics registration.

The following list of some of the Health Division's current publications illustrates the scope of the information produced by this division.

Economic Returns to Education

Statistics Canada has just published a monograph by Mr. R.A. Holmes on the economic returns to education in Canada. The author, assisted by members of the Current Economic Analysis staff, used micro-data from the Survey of Consumer Finances in his study. The report shows adjusted lifetime earnings of men and women by educational level, and the rates of return for the various levels.

Copies of the monograph *Economic Returns to Education in Canada,* Catalogue 13-556 are available from Publications Distributions, Statistics Canada, Ottawa, Ontario, K1A 0T6.

Revised Aggregate Productivity Measures

Productivity measures are one component of the System of National Accounts. They indicate the relationship of input to output. A new Statistics Canada publication presents revised aggregate productivity measures for 1946 to 1972. The productivity indexes relate real output to a single input, that is, labour time.

Copies of the *System of National Accounts, Aggregate Productivity Measures 1946-1972,* Catalogue 14-201, Annual, ($1.05) are available from Publications Distribution, Statistics Canada, Tunney's Pasture, Ottawa, K1A 0T6.

a statistical counterpart of the market or "money-exchange" economy. This is a reasonably good working description. Essentially, the Accounts are centred around the measurement of market-based activity – activity associated with the production of goods and services, and the sale of these goods and services in final markets. Thus, the Accounts provide a basic statistical picture of the key economic processes of production, income generation, sales to major markets, consumption, and capital formation.

The uses and applications of a system such as this are very numerous. The previous discussion of the historical setting has indicated in a general way how the use of the Accounts has evolved in the area of public policy. It might be useful to provide a brief summary description of some current uses and applications.

Current economic analysis – This is the most general use of the Accounts. They provide a central organizing framework for monitoring the current performance of the economy – for measuring and keeping abreast of changes in the growth of output, in the pattern of the income flows, and in the strength and composition of demand. The quarterly estimates provide the basis for such evaluation at regular intervals during the course of each year.

Short-term forecasting – Governments and businesses periodically undertake assessments of future economic prospects for purposes of planning their activities in the year ahead. Such short-term forecasts are ordinarily cast in the framework of the National Income and Expenditure Accounts. Within the federal government, it is customary for the Minister of Finance to estimate the government revenue yields in the year ahead on the basis of the forecast level of Gross National Product. This, combined with the estimates of spending commitments, permits a judgment to be made of the prospective government surplus or deficit. Conferences to assess the short-term economic outlook are now a fairly regular occurrence among business, government and academic economists. The Organization for Economic Cooperation and Development carries out a major forecasting exercise twice each year in which the economic prospects of all member countries are appraised and evaluated.

Background to the budget – Each year, when bringing down the federal Budget, the Minister of Finance makes an official statement on the economic situation, both in terms of current developments and trends as they have been emerging in the recent past and in terms of future prospects. This Budget statement is normally accompanied by an official White Paper in which the latest National Income and Expenditure statistics are reviewed and interpreted.

Medium-term projections – Assessments of medium-term potentials and prospects for the Canadian economy are regularly undertaken by the Economic Council of Canada. The Council's *Sixth Annual Review* (September 1969) set out the prospects for supply and demand, and saving and investment for the period 1967 to 1975. The *Ninth Annual Review* (November 1972) centred around an assessment of the economy's prospects and potentials through to the year 1980.

Studies of the sources of economic growth – Much new light has been shed in recent years on the sources of economic growth. Such studies have typically been carried out in the framework of the National Income and Expenditure Accounts. The growth in the productive capacity of the economy depends partly upon increases in the sheer physical quantity of resources used – increases in the number of people and in the volume of capital employed. But, a very large part of economic growth also comes from improvements in the quality of the resources used, such as higher levels of education in the work force and more technologically advanced capital equipment. In addition, growth is related to increases in the efficiency with which these resources are used, for example, as a result of shifts of labour and capital from less productive to more productive lines of activity, and through economies of scale and specialization. Studies of the sources of economic growth, particularly those by E. Denison in the United States and by D. Walters in Canada, have made it possible to assess quantitatively the relative significance of each of these particular factors in the growth process.[10]

Model-building – The National Accounts are now widely used in the construction of econometric models designed to simulate the behavior of the economy and to take account of feedback effects from one part of the system to another. Examples are the large annual growth model (CANDIDE) developed by the Economic Council of Canada in collaboration with a number of other government departments and agencies; the RDX2 model developed by the Bank of Canada, which is a quarterly model designed for short-term forecasting; and the TRACE model of the University of Toronto, which is also used for short-term forecasting.

Structural analysis – A good deal of information on the structure of the economy is revealed in the Accounts; for example, information on the structure of income, on the composition of demand, and on the industrial composition of production. The geographical distribution of personal and disposable income by major regions is also a feature of the system, and regional breakdowns of National Accounts aggregates are in strong demand. Some very striking changes in the structure of the economy have occurred during the

[10] The Canadian studies by Dorothy Walters for the Economic Council of Canada are: *Canadian Income Levels and Growth: An International Perspective* (Staff Study No. 23); and *Canadian Growth Revisited*, 1950-1967 (Staff Study No. 28). The Denison studies are noted on page 7, footnote 8.

post-war period. By way of illustration, in 1946, agriculture accounted for around 11 or 12 per cent of domestic production and national income, and for about 25 per cent of total employment in Canada. By the early 1970's, the share of agriculture in domestic production and national income had dropped to 2 to 3 per cent and its share in total employment to about 6 per cent. During the same time period, the value of production in the service industries rose from almost 50 per cent of total production to around 60 per cent, while employment in the service industries increased from 40 per cent of total employment to more than 60 per cent. On the demand side, personal spending on consumer goods and services has declined sharply as a share of Gross National Product, and government spending on goods and services has increased sharply as Canadians have chosen to allocate more of their output to collective consumption. The role of the government sector in the economy has expanded greatly in the post-war period, with total government revenues rising from 24 per cent of Gross National Product in 1950 to 37 per cent in 1972.

Education – In the general field of education, the Accounts provide a framework within which economic questions of public concern can be considered in their quantitative aspects. The habit of looking at economic problems in quantitative terms and in relation to overall economic magnitudes is a common feature of reporting in the country's financial press. The statistical framework represented by the Accounts is also a useful expository device in the teaching of economics.

Administrative uses – An important early administrative use of the Accounts in Canada was their adoption by the federal and provincial governments as the basis of adjusting the federal tax rental payments to the provinces in the 1947-57 period. About $2 billion of federal transfers was involved. Another administrative use of the Accounts has been in connection with Canada's contribution to international organizations.

The potential output and GNP "gap" analysis – The National Accounts provide the basic material for developing estimates of "potential" GNP, for measuring the "gap" between actual and potential GNP, and for calculating the high employment budget position. These analytical tools have played a prominent role in the work of the Economic Council of Canada, in connection with its annual reviews and performance reports.[11] Potential output is that output which could be produced if the labour force were fully employed and industrial capacity fully utilized. The shortfall of "actual" GNP in relation to the level of "potential" GNP is a measure of the output gap, or GNP "gap". If total demand for goods and services from all of the major spending sectors is not adequate to purchase the output which a fully-employed economy can produce, then "actual" output will decline below "potential" output, and unemployment will rise.

Information on GNP published by Statistics Canada deals with the definition and measurement of "actual" output and income – that is, with "realized" Gross National Product, and not with "potential" Gross National Product. But the "potential" or full employment level of Gross National Product is an important basic concept which is coming to be used more widely in economic analysis.

Consistency in statistical collection – The Accounts have important technical uses in establishing priorities and in enforcing consistency in statistical collection. Not only are the Accounts internally consistent in themselves, but, since they touch on all economic activity in the economy, further extensions of the general body of economic statistics are more efficiently considered in terms of comparability with them.

Canada's National Income and Expenditure Accounts have a comparatively short history; however, they have evolved to become an important factor in economic analysis and policy making.

ation r	Title and Description
F	*Revue Statistique du Canada*, mensuel. This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

Weekly Supplement to the Canadian Statistical Review—Free to *Canadian Statistical Review* subscribers.

Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).

Annual Supplement to the Canadian Statistical Review—Price $1.40 (Free to *Canadian Statistical Review* subscribers.)

Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).

Canadian Statistical Review—Historical Summary 1970, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers)

This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada nº du catalogue 11-003F.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted (SA) monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375) which is omitted from this publication for lack of space. The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. A special Canadian Statistical Review tape is created about the 15th of each month which contains historical and current data for all series in this Review. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. The date in the base may therefore be more timely than data on the CSR tape. For additional information, see inside back cover.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

* * * * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for selected economic indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

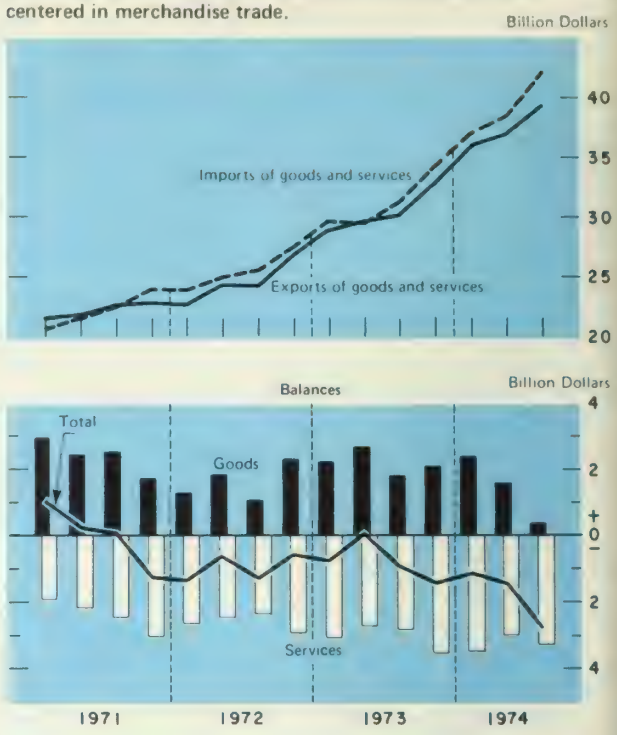

Section 4, Tables 9 to 16

Users are asked to note the revisions of the employment indexes, average hourly earnings and average weekly hours data. Information on historical revisions can be obtained from Mr. G.L. Cohen, Labour Division, Statistics Canada.

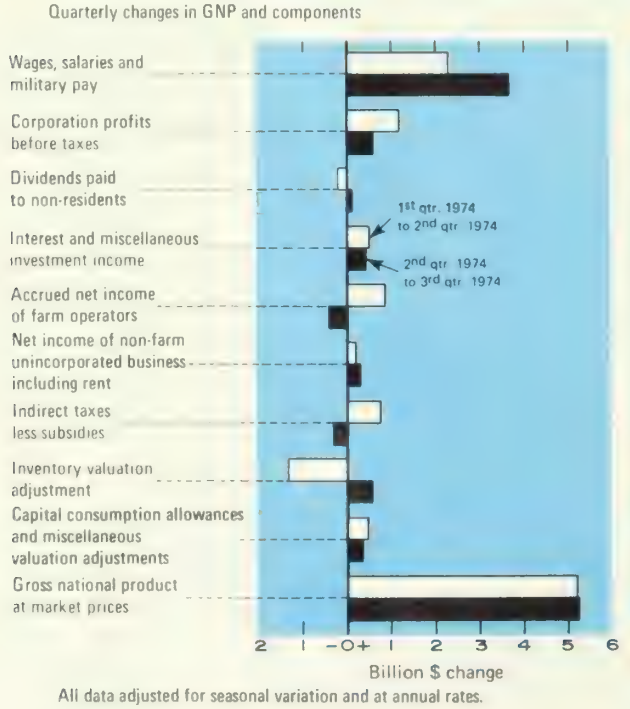

Gross National Product, seasonally adjusted at annual rates, increased by 3.8 per cent to $143 billion. As in the second quarter, prices accounted fully for this increase.

Activity in the external sector was a major cause of the third quarter weakness in total Gross National Expenditure. Exports rose 5.9 per cent, while imports were up 9.3 per cent, raising the deficit to $2,772 million, compared to $1,396 million in the second quarter. This deterioration in the balance was centered in merchandise trade.

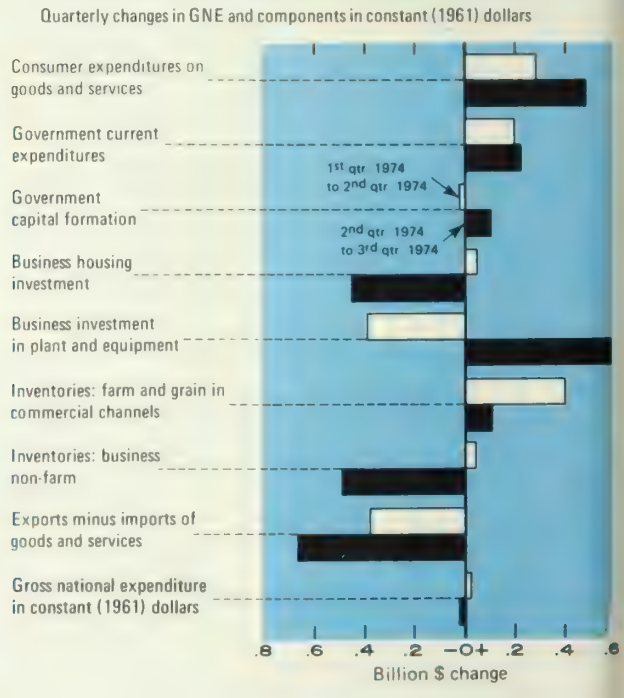

Wages, salaries and supplementary labour income, after a second quarter deceleration, recorded its largest quarterly percentage increase since early 1951. Corporation profits before taxes continued to grow but at a lesser rate than in the preceding several quarters. Farm income declined sharply from its second quarter level.

All data adjusted for seasonal variation and at annual rates.

A decline in spending on consumer durables coupled with a strong acceleration in other categories of consumer expenditure produced an overall real increase of 1 per cent. The second quarter contraction in real gross fixed capital formation was reversed in the third quarter, mainly as a result of a spurt in investment in machinery and equipment.

NATIONAL INCOME AND EXPENDITURE ACCOUNTS

Third Quarter 1974

Introductory Review

In the third quarter, Gross National Product in real terms was again unchanged from the level achieved in the first quarter. Prices continued to rise, but there was some abatement in the rate of increase for most categories of expenditure. Final domestic demand was strong, despite a substantial cutback in residential construction. There was a further deterioration in the trade balance as the growth of imports exceeded that of exports. Notwithstanding a weakness in industrial production, employment, as measured by the Labour Force Survey, increased by a substantial 1.3 per cent. This was not enough to offset the growth of the labour force, and the unemployment rate increased during the quarter.

Gross National Product, seasonally adjusted at annual rates, increased by 3.8 per cent to $143 billion. As in the second quarter, prices accounted fully for this increase. Current dollar consumer expenditure increased at an accelerated rate of 3.9 per cent during the quarter. A decline in spending on consumer durables coupled with a strong acceleration in other categories of consumer expenditure produced an overall real increase of 1 per cent. The second quarter contraction in real gross fixed capital formation was reversed in the third quarter, mainly as a result of a spurt in investment in machinery and equipment. Government current expenditure in real terms also made an important contribution to the 1.2 per cent increase in final domestic demand. There was continued strong accumulation of business non-farm inventories.

Among income components, there were significant changes from the pattern of growth witnessed in the second quarter. Wages, salaries and supplementary labour income, after a second quarter deceleration, recorded its largest quarterly percentage increase since early 1951. Corporation profits before taxes continued to grow but at a lesser rate than in the preceding several quarters. Farm income declined sharply from its second quarter level.

Consumer Outlays

Personal expenditure on goods and services rose to $81.3 billion, an increase of 3.9 per cent, following a second quarter increase of 3.5 per cent. Outlays on goods decelerated, as in the second quarter, while spending on services accelerated. In volume terms, the gain in personal expenditure was 1 per cent, compared with 0.6 per cent in the second quarter; the increase in the implicit price index for consumer expenditure registered a slight deceleration, from 2.9 per cent in the second quarter to 2.8 per cent in the third.

Spending on consumer durables grew by only 1 per cent, and since prices rose by 3.3 per cent, spending on durables in real terms declined by 2.2 per cent. Decreases in purchases of furniture, household appliances and recreation equipment neutralized the 6.1 per cent real increase in sales of new and used automobiles. The increase in prices represents an acceleration from the second quarter increase of 2.6 per cent; car and household appliances prices led this acceleration.

Expenditures on semi-durable and non-durable goods increased by 6 per cent and 4.5 per cent respectively during the quarter. The gains in the semi-durables group were spread among clothing, footwear and household furnishings, and after allowing for price increases, the volume increase in semi-durables was a very strong 3.3 per cent. Within non-durables, expenditures on food continued to increase at about the same rate as in the previous quarter. Food prices continued to climb but there was some deceleration in the rate of increase. Outlays on gasoline, oil and grease increased at a faster rate than in the second quarter, while there was a moderation in price increases of these products and of home heating fuels.

Consumer expenditure on services increased by 3.7 per cent, an acceleration from the previous quarter. This strength was based on increased spending on rents and lodging, and on household services and purchased transportation. Insurance and hospital care registered strong price increases, which were offset by lower rates of increase in prices of other items so that the implicit price for services rose by 2.7 per cent, the same as in the second quarter.

Fixed Capital Formation

Business gross fixed capital formation was up 4.5 per cent in the third quarter. In real terms, this increase was only 1 per cent.

The weakness stemmed from the housing component which was down 4.9 per cent in current dollars, and 10.6 per cent in real terms. Housing starts during the second and third quarters were down 15 per cent from the previous six months. Starts in the third quarter declined by 22.9 per cent, which was the most serious slowdown since the first quarter of 1971. Because of construction lags and because all types of dwellings – singles, multiples and apartments – were affected, this decline in starts will continue to be felt for several quarters.

Housing prices were up 6.5 per cent in the third quarter. The deceleration since July in the list prices of residential building materials will show up with at least a one quarter lag.

Investment in business plant and equipment was a source of strength in the quarter. Non-residential con-

struction expenditures were up 2.6 per cent in real terms over the strike-affected second quarter, with building and engineering sharing equally in the rise. The rate of price increase slowed considerably, from 5.4 per cent in the second quarter to 2.4 per cent in the third.

The main strength in business capital formation was in machinery and equipment, which rose by 7.2 per cent in real terms. A surge in expenditures on all categories of imported machinery and equipment was primarily responsible for the increase, as domestic shipments rose only moderately. The price rise of 3.9 per cent was somewhat above the 3.4 per cent increase in the second quarter.

Inventory Investment

Investment in non-farm business inventories in the third quarter was at a level of $2,032 million. After accumulations of $2,672 million and $2,740 million in the first two quarters of the year, the third quarter, although strong, represents a considerably lower rate of investment. A slowdown in accumulation in wholesale trade was responsible for most of the $700 million cutback, although there were additions to stocks at all three major industry levels.

Within manufacturing, investment in stocks of non-durables was the major source of accumulation, accounting for two-thirds of the total. Most categories of non-durables showed increases, with the exception of food and beverages where stocks showed a sizable liquidation. In durables, a substantial decrease in stocks owned by the primary metal industries was more than offset by increases in all other manufacturing industries. Increases were widespread within wholesale and retail trade. Major exceptions, however, were motor vehicles, motor vehicle parts and accessories, and petroleum bulk tank stations. Stock-to-sales ratios were somewhat higher than those of the previous quarter for the three major industry levels.

The External Sector

Activity in the external sector was a major cause of the third quarter weakness in total Gross National Expenditure. Exports rose 5.9 per cent, while imports were up 9.3 per cent, raising the deficit to $2,772 million, compared with $1,396 million in the second quarter. This deterioration in the balance was centered in merchandise trade, as the surplus moved from $1,632 million in the second quarter to $412 million in the third.

Merchandise exports were up 7.4 per cent in current dollars and 4.2 per cent in real terms. The 3 per cent price rise represented a notable deceleration from recent quarters. The growth in exports was attributable to increases in motor vehicles and parts which outweighed decreases in all other major groupings. The wheat, fuel and lumber components declined markedly.

Merchandise imports rose 11.9 per cent in current dollars, with a 4.7 per cent price rise. The 7 per cent real increase represents a turnabout from the second quarter decline of 0.3 per cent. The major source of the import growth was finished goods, with some additional strength coming from semi-finished goods. Imports of all categories of industrial machinery and equipment increased significantly. Autos, trucks and parts recovered strongly from a weak second quarter performance. The volume of imports of food, feed and beverages rose moderately, while that of crude materials dropped, due to a reduction of fuel imports.

The slight deterioration in the deficit on non-merchandise trade was due to continued declining tourist and travel receipts.

Incomes

Labour income rose 5.1 per cent in the third quarter of 1974, a sharp acceleration from the second quarter increase of 3.3 per cent. As already noted, this was the highest quarterly increase since the early fifties. Most of the increase was due to the payment of lump sum cost-of-living allowances in the public sector and higher average earnings throughout the economy.

Wages and salaries in the goods-producing industries increased by 4.2 per cent, compared with an increase of 2.1 per cent in the second quarter. The higher rate of growth in the third quarter was attributable to gains in average earnings, particularly in the manufacturing and mining industries, and to the cessation of major labour disputes in the construction industry.

Wages and salaries in the service-producing industries advanced sharply in the quarter, by 5.8 per cent. The sharpest increase occurred in the community, business and personal service industries, which rose by 8.1 per cent, largely as a result of the payment of cost-of-living allowances to some school and hospital employees. Increases in the other industries were largely due to higher average earnings.

Corporation profits grew by 3.3 per cent in the third quarter following an increase of 7.1 per cent in the second. Within manufacturing, paper, printing and publishing, and primary metals recorded significant increases while rubber and wood declined substantially. In the non-manufacturing group, transportation, communications and utilities declined while retail trade increased moderately. For the first nine months of 1974, profits before taxes were more than 35 per cent higher than in the same period in 1973.

The inventory valuation adjustment, intended to remove from income those profits which do not reflect current production, declined moderately this quarter, but remained at a very high level. The IVA in the third quarter was $4.0 billion, compared with the record level of $4.6 billion in the second quarter.

Accrued net income of farm operators from farm production declined by 10 per cent in the third quarter from the high second quarter rate. Labour disputes, which disrupted the export movement of grain, and some price decreases were major factors in this drop.

Personal income rose by 4.6 per cent in the third quarter, compared with a 3.6 per cent rise in the second. However, because of a very sharp increase in tax collections, personal disposable income rose by only 2.1 per cent compared with 4.7 per cent in the previous quarter. This led to a drop in the personal savings rate from an irregularly high level of 9.1 per cent in the second quarter to 7.5 per cent in the third.

The Government Sector

Seasonally adjusted at annual rates, total expenditures of all levels of government combined, excluding intergovernmental transfers, rose by 7.7 per cent in the third quarter, much more sharply than in the second quarter and the highest quarterly increase in several years. About half the increase took place in spending on current goods and services which rose by 7.1 per cent with particularly large increases at the federal, local and hospital levels. The increase in the latter two levels largely reflected the payment of costs-of-living allowances. After a decline in the second quarter, subsidies increased by more than $1 billion in the third quarter, mainly because of a very large increase in the subsidies to oil importers in eastern Canada and higher dairy payments. Transfer payments to persons rose 4.8 per cent, mainly at the federal level as a result of increases in family and youth allowance and unemployment insurance benefit payments.

Total revenue of all levels of government combined also rose much more sharply in the third quarter than in the second quarter, 8.8 per cent compared with 2.2 per cent. Reflecting the continuing high levels of income, revenues from direct taxes rose strongly. The largest increase was in revenues from personal direct taxes, up by 16.8 per cent from the second quarter which was affected by unusually high refunds. Corporate direct taxes rose by 5.8 per cent. Recent proposed changes in corporate tax legislation have not been incorporated in the estimated tax liability although some companies, through their reported tax provision, may have attempted to reflect these changes. Indirect taxes increased by 3.7 per cent with most of the increase at the federal level due to the oil export charge. The other revenue components also showed increases.

As a result of expenditures rising more slowly than revenues, the surplus of the government sector on a National Accounts basis and including the Canada and Quebec Pension Plans increased from $2,068 million in the second quarter to $2,736 million in the third quarter.

TABLE 1. National Income and Gross National Product, by Quarters, 1973 and 1974

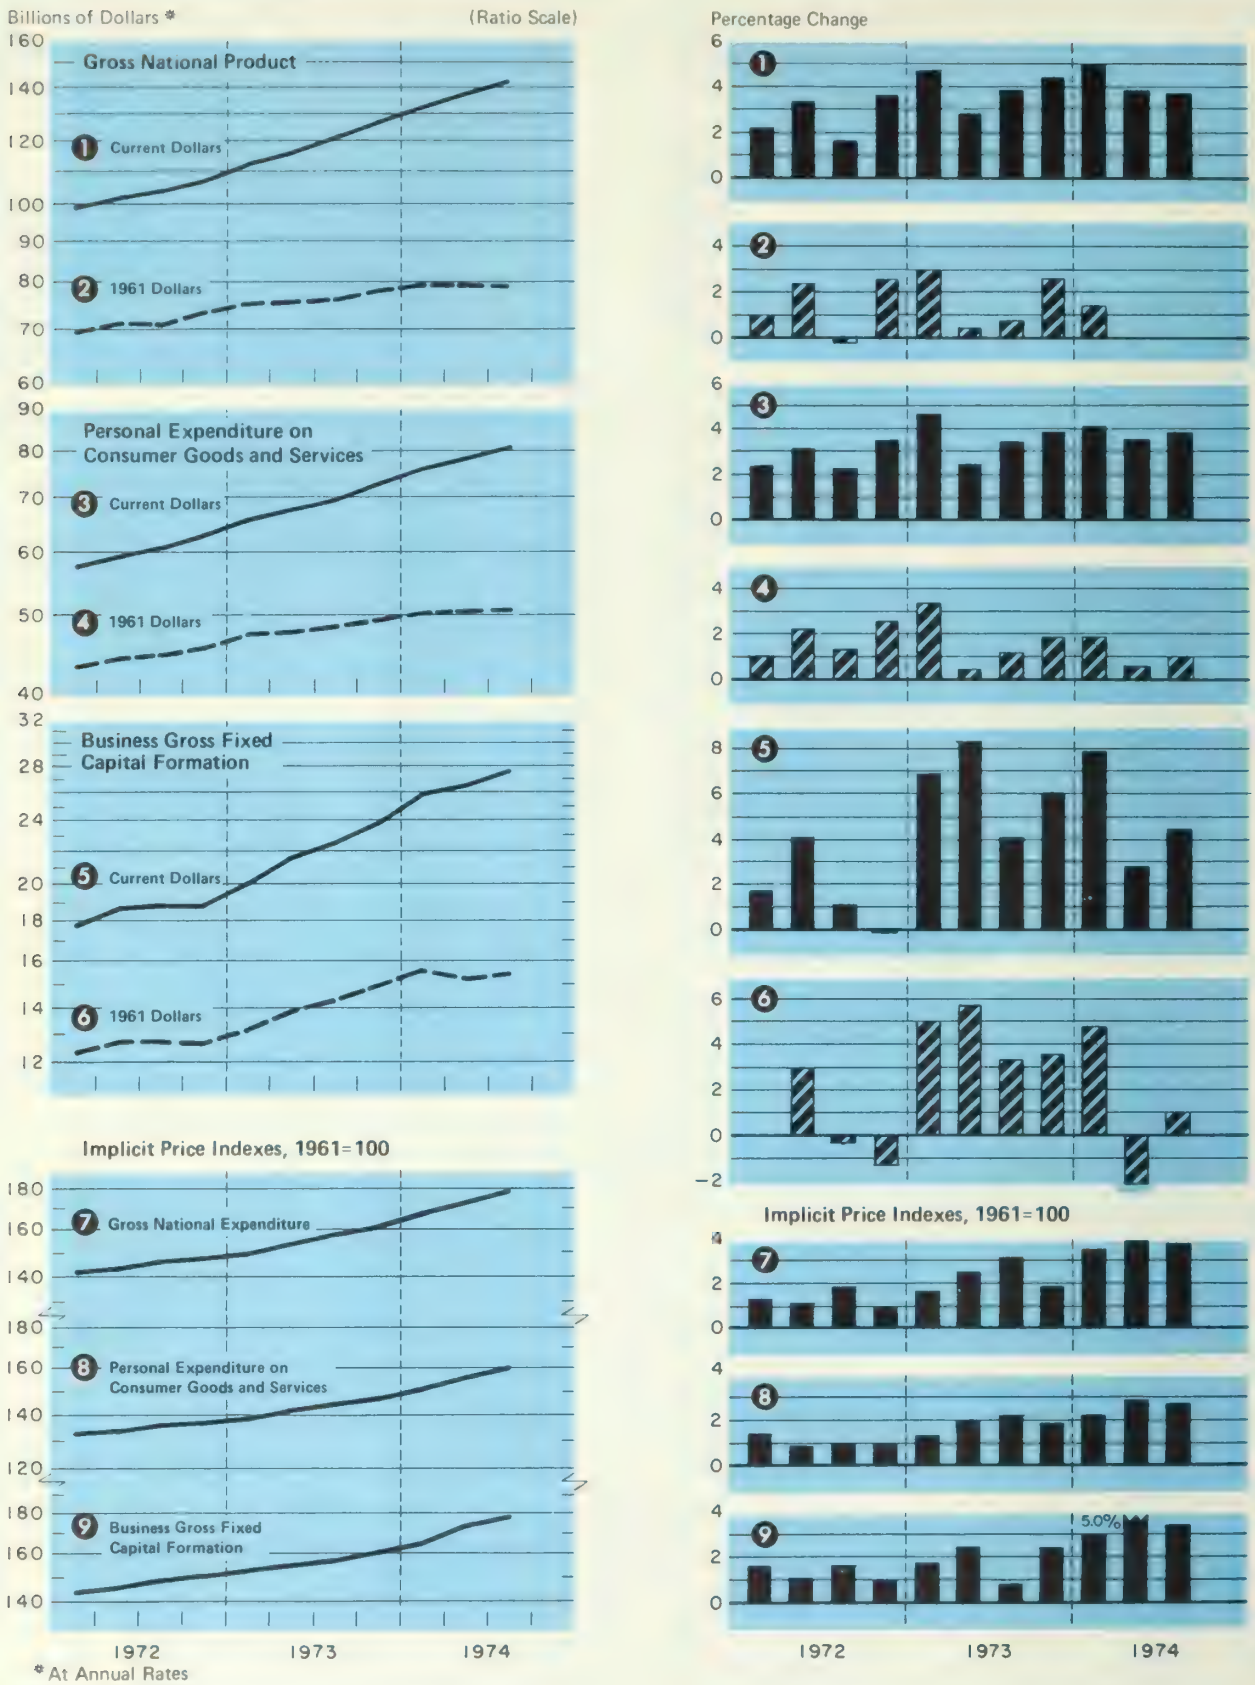

Seasonally adjusted at annual rates

[1] Excludes profits of government business enterprises.
[2] Includes the withholding tax applicable to this item.
[3] Includes profits (net of losses) of government business enterprises and other government investment income.
[4] Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the change in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.
[5] Includes net income of independent professional practitioners.
[6] See footnote 4, of Table 2.

[1]The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does not include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. **Source: Quarterly Bulletin, Department of Manpower and Immigration.**

[1]Excludes profits (net of losses) of government business enterprises. [2]Includes the withholding tax applicable to this item. [3]Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4]Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5]Includes net income of independent professional practitioners. [6]See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes defence expenditures. [2]Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3]Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4]The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5]See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are ected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter vements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of ce change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are ≥ated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of ≥e treatment of insurance. [2]Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3]Withholding taxes. [4]The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have ≥en generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source ≥e Table 1.9.**

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

[1]The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2]The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

See footnotes, Table 3.

*In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series provide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: selected series by sex and main age group (thousands of persons)

[1]Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2]Annual figures are averages of 12 months. [3]Includes adjustments for cancellation of warrants and collection of overpayments. **Sources: Statistical Report on the Operation of the Unemployment Insurance Act (73-001) Statistics Canada.**

[1]In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2]The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3]The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4]The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5]Includes miscellaneous manufacturing industries. [6]Includes publishing and allied industries. [7]Includes storage and communication industries.

[1]The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2]Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3]Includes storage, electric power, gas and water utilities. [4]Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

These data were revised in the December 1974 issue of the Canadian Statistical Review. See Note to Users for that month.

[1]See footnote 1 and source in Table 10. [2]Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4]Except machinery and transportation equipment industries.

Table 12: average weekly wages and salaries,[1] by industrial division, based on the 1960 standard industrial classification (dollars)

Year and month	industrial composite	forestry	mining, including milling	manufacturing			construction	transportation, communication and other utilities	trade		finance, insurance and real estate	service
				total	non-durable goods	durable goods			wholesale	retail

[1]The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explonatory notes are given in the source publication named below. [2]In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1]Indexes prior to May 1973 incorporate 1957 expenditure weights (1964 for Quebec City and Thunder Bay), those for May 1973 forward are based on 1967 expenditures. The revised series is linked to its predecessor at April 1973. [2]The previous supplementary classification has been revised. Historical series relating to the revised classification replace the previously published supplementary indexes. [3]Includes constant weighted food component. [4]These rounded weights, based on 1967 expenditure patterns, are provided as a general guide to the relative importance of C.P.I. major components from May 1973 forward. [5]Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. Source: Prices and Price Indexes (62-002), Statistics Canada.

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

annual average and month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month: owned[3]	inventory at end of month: held but not owned	all inventory held: total	all inventory held: raw materials	all inventory held: goods in process	all inventory held: finished products	ratio of inventories owned to shipments

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2]Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3]Total manufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1]Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2]Intended for cigarettes. [3]Includes smoking, chewing and twist. [4]Includes sales to wholesalers or retailers. [5]Subject to Excise Tax. [6]Includes sales for ships' stores and for export. [7]End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Statistics Canada; and Department of National Revenue.**

[1]Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2]Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3]Includes appliances and utensils. [4]Excluding shipments for re-processing at maker's own plant.

[1]Production plus imports less re-exports, minus exports. [2]Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the post. **Sources: Motor Vehicle Shipments (42-002), New motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.**

[1]Barrels of 35 Canadian gallons. [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

[1]The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. **Source: Building Permits (64-001), Statistics Canada.**

[1]A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: New Residential Construction (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1]Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2]1972 and 1973 price indexes are subject to revision. [3]1973 price indexes are subject to revision. [4]Farm share only of motor vehicles. [5]In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6]In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1]Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and fats. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

[1]Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. [2]Includes Yukon and North West Territories. Source: Retail Trade (63-005), Statistics Canada.

Note: Components may not add to totals because of rounding.

[1]Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2]Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3]Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4]Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5]Includes bank-sponsored credit card balances. [6]The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7]Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8]Bills due for non-commercial use of telephones, gas and electric power. [9]Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.**

[1]Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1]Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

Table 1: carloadings of revenue freight on Canadian railways[1] (thousand cars)

year and month	total railway revenue freight loadings (carload and non-carload) ('000 tons)		total revenue cars loaded (carload only)	farm products and food						mine products			
	Can.	U.S.		wheat	other grain and grain products	fresh fruits and vegetables	other agriculture products	animals and their products	prepared food products	iron ore and concentrates	other metal ores and concentrates	potash	coal, sand, cement and other mine products

[1]Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973, only 6 major railways (accounting for 95 per cent or more of the total operating revenues) are shown. [2]The data for August 1973 do not follow the pattern for the other months of 1973. The decreases in most categories are a result of the railway strike in this month. **Source: Railway Operating Statistics (52-003), Statistics Canada.**

[1]Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2]Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada.**

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Excluding Canadian day-to-day loans. [7]Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8]Loans to grain dealers and exporters. [9]Loans to finance purchase of Canada Savings Bonds at time of issue. [10]Including loans to instalment finance companies. [11]These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

NOTE: Components may not add to totals because rounding. [1]This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2]Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing Centres (61-001), Statistics Canada.**

[1]The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2]The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3]Combines the industrials, utilities and finance common stocks. [4]Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5]Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6]Stocks included in the mining index are for producing mines. [1]This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie arm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-eld funds, and taxes collected on behalf of and transferred to other governments. [2]Beginning in December 1973, this category includes oil export tax. [3]March ncludes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

TABLE 2. Gross National Expenditure, by Quarters, 1973 and 1974

Seasonally adjusted at annual rates

	1973					1974		
	I	II	III	IV	Year	I	II	III
	$'000,000							
Personal expenditure on consumer goods and services	66,060	67,676	69,972	72,668	69,094	75,664	78,308	81,324
Government current expenditure on goods and services[1]	22,056	22,092	23,000	23,968	22,779	24,764	26,026	27,864
Gross fixed capital formation	24,176	26,112	27,180	28,540	26,502	30,676	31,572	33,100
Government[2]	4,104	4,372	4,552	4,552	4,395	4,804	4,968	5,312
Residential construction	24	32	24	20	25	24	32	28
Non-residential construction	3,584	3,824	3,892	4,000	3,825	4,220	4,352	4,692
Machinery and equipment	496	516	636	532	545	560	584	592
Business[3]	20,072	21,740	22,628	23,988	22,107	25,872	26,604	27,788
Residential construction	5,584	6,656	6,704	7,088	6,508	7,428	8,048	7,656
Non-residential construction	6,712	7,084	7,352	7,748	7,224	8,436	8,492	8,924
Machinery and equipment	7,776	8,000	8,572	9,152	8,375	10,008	10,064	11,208
Value of physical change in inventories	988	424	1,348	1,416	1,044	1,616	2,568	2,608
Government	− 24	− 52	0	16	15	24	12	24
Business:								
Non-farm[4]	1,260	652	344	1,436	923	2,672	2,740	2,032
Farm and grain in commercial channels[5]	− 248	176	1,004	36	136	1,032	− 160	600
Exports of goods and services	29,024	29,804	30,236	32,900	30,491	36,148	37,332	39,544
Deduct: Imports of goods and services	− 29,804	− 29,776	− 31,208	− 34,316	− 31,276	37,260	− 38,728	− 42,316
Residual error of estimate	484	196	52	732	268	620	376	548
Gross National Expenditure at market prices	**112,984**	**116,136**	**120,580**	**125,908**	**118,902**	**132,228**	**137,444**	**142,672**
Detail of farm inventories and GICC:								
Value of grain crop production	− 204	140	400	208	134	− 728	− 640	− 328
Depletions of farm stocks of grain								
Chabge in other farm-held inventories	176	440	860	124	400	216	144	424
Grain in commercial channels	220	476	544	368	130	88	336	504

[1] Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts, Second Quarter, 1974*, Catalogue 13-001.

[2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

[3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

[4] The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

[5] In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

TABLE 3. Gross National Expenditure in Constant (1961) Dollars, by Quarters, 1973 and 1974[1]

Seasonally adjusted at annual rates

	1973					1974		
	I	II	III	IV	Year	I	II	III
	$'000,000							
Personal expenditure on consumer goods and services	47,424	47,624	48,196	49,088	48,083	50,020	50,308	50,792
Government current expenditure on goods and services	11,664	11,528	11,848	12,160	11,800	12,376	12,576	12,788
Gross fixed capital formation	15,908	16,776	17,316	17,760	16,940	18,532	18,168	18,420
Government	2,668	2,800	2,876	2,816	2,790	2,864	2,844	2,948
Residential construction	16	20	12	12	15	12	16	12
Non-residential construction	2,252	2,364	2,360	2,392	2,342	2,436	2,404	2,516
Machinery and equipment	400	416	504	412	433	416	424	420
Business	13,240	13,976	14,440	14,944	14,150	15,668	15,324	15,472
Residential construction	3,368	3,888	3,876	4,028	3,790	4,160	4,208	3,760
Non-residential construction	4,104	4,220	4,364	4,464	4,288	4,664	4,456	4,572
Machinery and equipment	5,768	5,868	6,200	6,452	6,072	6,844	6,660	7,140
Value of physical change in inventories	828	464	412	1,348	763	1,212	1,644	1,256
Government	20	40	12	16	14	− 4	− 16	− 36
Business:								
Non-farm	1,084	576	356	1,288	826	1,660	1,704	1,220
Farm and grain in commercial channels	236	72	68	44	49	− 444	− 44	72
Exports of goods and services	21,548	21,108	20,496	20,916	21,0 7	21,004	20,360	20,876
Deduct: Imports of goods and services	22,344	21,744	22,144	− 23,584	− 22,454	− 24,224	− 23,960	− 25,144
Residual error of estimate	348	100	56	480	196	372	216	304
Gross National Expenditure in constant (1961) dollars	**75,376**	**75,656**	**76,180**	**78,168**	**76,345**	**79,292**	**79,312**	**79,292**

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

Other Publications of the General Time Series Staff

lication ıber	Title and Description
003F	*Revue Statistique du Canada*, mensuel. This is the French edition of the *Canadian Statistical Review*.

Canadian Statistical Review Supplements

004	*Weekly Supplement to the Canadian Statistical Review*—Free to *Canadian Statistical Review* subscribers. Contains figures produced by Statistics Canada and other agencies which are released during the week of issue. The data will, of course, appear in the following issue of the *Canadian Statistical Review*. Designed to keep users of the *Review* closely informed of the most recent changes in the major statistical series (Bilingual).
206	*Annual Supplement to the Canadian Statistical Review*—Price $1.40 (Free to *Canadian Statistical Review* subscribers.) Contains monthly and quarterly historical records, adjusted and not adjusted for seasonality, of all the series of Section I of the *Canadian Statistical Review*. The series extend back to 1946 or as far back as the data are available (Bilingual).
505	*Canadian Statistical Review—Historical Summary 1970*, E. and F. Price $1.50 (Free to *Canadian Statistical Review* subscribers) This publication replaces the *Historical Summary* 1963 (catalogue no. 11-502, Occasional). It contains annual data for series published in the monthly *Canadian Statistical Review* (11-003). Its contents, table headings and table numbers, with a few exceptions, are the same as those in the tabular section of the *Review*. All tables include 1970 data, some have 1971, and extend back to 1926, or as far back as available. The figures were the latest available early in 1971.

CANSIM Manuals and other Publications*

—	*CANSIM: An Introduction to the Canadian Socio-economic Information Management System*—Free on request. Order by title from General Time Series Staff.
—	CANSIM: *Progress Report*—Free on request. Order by title from General Time Series Staff.

Publication number	Title and Description

CANSIM Manuals and other Publications (Cont'd)

*12–530	*CANSIM: Operational Manual for Data Entry* (Occasional)—Price $1.40 This manual will be of practical interest only to federal government agencies which store and maintain time series in the CANSIM data base. Users desiring a fuller knowledge of the codes used and the storage methodology will find this volume a useful companion to the Retrieval manual. (Available in French, catalogue no. 12-530F.)
*12–531	*CANSIM: Users Manual for Data Retrieval and Manipulation* (Occasional) 1973 edition—Price $2.10 Gives detailed instructions on procedures for obtaining data from the CANSIM data base. The new edition reflects enlargement and improvement of the retrieval package. (Available in French, catalogue no. 12-531F.)
—	CANSIM: *Summary Reference Index* (Annual, with periodic amendments) 1974 edition—Free on request. This index summarizes data available from CANSIM and provides matrix identifiers. Order by title from General Time Series Staff.
—	CANSIM: *Series Directory* (Annual, with periodic amendments) 1974 edition—Price $15.00, or $20.00 with amendment service. The CANSIM *Series Directory* contains matrix and series titles and descriptive detail for series available from CANSIM. It is used in conjunction with the *Summary Reference Index* and CANSIM *Manual for Data Retrieval and Manipulation* (12-531) to order series from Stastitics Canada. Order by title from General Time Series Staff.

This Review, the above and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General of Canada. For further information direct inquiries to:

General Time Series Staff,
R. H. Coats Tower,
Statistics Canada,
Ottawa, K1A 0T6.

mendments to catalogue numbers 12-530 and 12-531 will be issued periodically and will be available from the Publications Distribution, tistics Canada.
